Thank you John, the address is: sctvguy1 at adelphia.net
I have never had one of these before and the wire is just bare, the
guy must have had it soldered in or something.

Thank you for your suggestions, g. beat !

>> 26Z5W rectifier tubes are difficult to obtain

Well, this is why I want to use diodes instead,
and custom-made solid-state plug-compatible
copper-cased replacements are too much
for me when a couple of 1kV/3A diodes
+ a resistor will do.

I am more a user than a finicky collector!

Space is a bit tight in the PS
and I am sure there is a "best practice" for this!

****
Does anyone have experience with putting
the resistor in a particularly appropriate
physical spot in the PS
where it won't cause too much trouble? :-)
****

Thank you in eager anticipation!

The standard military conversion was to scrunch the
socket flange, so that the 26Z5W's cannot be plugged in,
and to solder a pair of diodes to the pins of the socket.
No resistor was used.

Hi Gang:

This must be of interest to the Hallicrafters crowd. I am not sure what it is but it is a piece of MIL gear (transmitter I think), the T-14I/TRC-1. Idon't know much about it but it is in its' transit case, the CY17 and it was made by Hallicrafters.

I certainly don't have any interest in it so I'm offering it up to the community.I'm asking $75.00 for it plus shipping or pickup in Vermont (two hours from Boston). I will deliver to Hosstraders in Hopkinton NH May 5th and 6th. It weighs 90 pounds so calculate shipping from 05047.

If interested please reply by e-mail.

Hi Gang:

I found this in the basement and don't need it because I don't have this piece of equipment. I can't even recall how I came to have it. If you have one of these freq meters (with the cool film strip readout) missing the cover here's your chance to pick it up. It is in very clean condition; paintwork is excellent with a couple of die-size abrasions on the front. Rubber sealing gasket is excellent. The AC line cord is also there but the plug is missing. I'm asking $15.00 plus postage for it; any takers? Please reply by e-mail.

Tnx es 73,

Michael, W1RC

Well, I gave everything a very close visual check and didn't see any problems. I cleaned up some suspect solder connections, made sure there were no shorts or even just some things barely touching each other and plugged it in. Better, but not there yet. I tapped a few things here and there and found that the 6SK7 RF amp tube was just not right. Lots of static when I tapped it with a long piece of plastic. I replaced it with a tube from my other S-20R and bingo, better than ever. So I guess visual checks and a bit of detective work solved this mystery and prevented major surgery. Thanks to all who offered their suggestions.

Thank you Chuck!

I knew the Navy standard mod.

It was not optimal, as it raised plate voltage above spec, leading to
extra current, more heat, higher risk of cap failure and additional
tube wear, in exchange for not much.

I get the message, I'll stop asking.
It must be classified information. :-)

I doubt that anyone is holding out on you, but rather that they
just don't know.

The manual I use most for my R390A is: "The 21st Century R-390A/URR
Technical Reference" It was put together by a handful of enthusiasts
and can be downloaded from the web. It is a work in progress, but already
is better than anything that the government did.

I notice looking at their schematic for the power supply, there
is a 200-220 ohm resistor stuck in the AF subchassis that is
in series with the silicon diodes, and between the assembly's connector,
and the choke input filter. It is marked with "REFER TO EIB895".
I know that EIB702 is the diode replacement, I suspect that EIB895 is
the cure for overvoltage caused by EIB702.

I would suspect that this resistor is mounted under the input inductor
for the power supply's filter.

Here's an interesting Home Brew item....

This is a three tube 28 MHz to 220 MHz linear converter built on a piece of PC Board stock. It uses three tubes, a 6AN8 and 2 6360s. Looks like it's all there but there is a bit of work that remains to be done. The schematics are most likely from an ARRL Handbook from the 60s or 70s. It is very well constructed using ceramic tube sockets and trimmer caps.

I am asking $30.00 plus postage for it. If interested please reply by e-mail.

1954. Re: R-390A w/ SS power diodes - where do I stick the drop resistor?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-04-29 13:33:03 UTC
From: SpamHog <n1jpr@hotmail.com>
Message-ID: <1146317583.700138.153480@y43g2000cwc.googlegroups.com>
Source record: 12504

Thank you for the pointer, I just dl'ed that manual.

I wasn't being serious about people's unwillingness to part with the info!

The HRO-500 manual has recently provided me with bedtime reading for about 3 weeks, but the R390-A tome should last much longer, and promises to be even more interesting!

1955. Raffle of Drake TR5; 3 weeks left

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-04-29 17:29:52 UTC
From: Sindre Torp <sindtorp@online.no>
Message-ID: <VaydnZ5zMfEXP87Z4p2dnA@telenor.com>
Source record: 12505

Hello all,

It's only 3 weeks till the drawing of the Drake TR5 at The Dayton Hamvention. There are plenty of tickets left, but no more than 150 tickets will be sold. You'll find info about the raffle of the Drake TR5 here: http://home.online.no/~sindtorp/tr5raffle.htm

Thanks for your support!

There's also some info about The Drake Forum; Dayton Hamvention 2006
And you'll find all about The Dayton Hamvention here: www.hamvention.org

See you at The Drake Forum in 3 weeks!

73,
Sindre, LA6OP

Source record: 12507

Hi All,
Times are getting tougher financially and I may have to part with my Hallicrafters R12 Bass Reflex speaker. Can anyone give me a ballpark estimate on its worth? I can supply photos in order to make the evaluation easier. I tried looking on eBay, but apparently they don't come up very often as there are none in there to compare against. The R12 is in Chuck Dachais' book, but has no value listed. Thanks in advance.
rgds,
Mark S.

No, it's not; the name collision is an unfortunate coincidence.

Text-only newsreader users be warned: the ads and notices, while usually interesting and very seldom spam, _do_ tend to be in HTML only, so that you have to go to the trouble of lighting up a browser, or at least an instance of lynx, to read them -- a minor-to-moderate pain in the sitting parts.

(quoted material below)

I read a couple other guy's comments as well. If there is an RF amplifier ahead of the converter (converter = mixer+ oscillator), then something is dead in that stage (coils, variable cap shorted/shorting, dead tube, open interstage capacitor, and other possibilities). Dead tubes can have blown filaments (if the receiver is on for a while, an open filament tube will still be cold compared to the other tubes), or internal short, or gassy tube, or weak cathode emission, lots of things. Whatever the RF stage is, if that tube is identical to the IF stages, then swap the tube (RF into IF socket) and if the whole receiver goes dead, then its that tube that is dead. Get a new tube. Preferably you should try to locate someone with a tube tester (this may not be practical in an age where everything is: i) throw away, and ii) all solid state). All the other things you need to do, need lots of checking and a schematic. If you can't get one, then you have to trace it out by hand and use a tube manual to get pinouts on the tubes. I'll keep reading from time to time; will post if I have any bright ideas.

NOS never been fired up. I removed it from it's factory packing. It's essentially brand new. Made around 1970. I believe these were also used by the Vietcong during the war. It includes two sets of headphones and the radio has two jacks also. it has a complete extra set of new tubes and fuses etc... All its carrying straps and accessories bag are in new condition. All leather is new and pliable. Very nice unit. $200

I have a Hammarlund HQ-170 receiver that I'm going to start on here shortly, but it was one that was originally bought without the optional Telechron clock, so all it has is the lens there showing the Hammarlund emblem. Does anyone know if replacement clocks are available, or does anyone have one they'd be willing to sell ??
Thanks,
Ben

1982. Needed Antirsu RG52A Receiver Manual

I don't think I've spent that much on everything but 3 of all the
electrical audio and TV widgets I own! I MEAN INDEED, the last three
put me over maybe by 150.00. ALL my tubed TVs, radios, Sony sets,
Stereo gear, Speakers, computer and embryonic computers and parts
sets/future repaired sets.

That guy's just loco. I'll make up for him and go snag a pair of 3-way
vans to transplant Pioneer and Jensen into and hopefully a Philips High
Fidelity Laboratories receiver in really decent working shape for under
15 dollars. Then I'll keep saving for an Emerson with SW I really like.

If I don't get my Teac dubber to stop eating tapes after
demagnetization, I'm going to build a booth and target and charge the
neighbors for chances to shoot it GRRR It ate my Joan Baez GH tape

dammit. That was despicable...oh well. And YEAH, I know somebody isn't paying 800 bucks for a stupid kit. You go get Elliot Ness, I'll call Joe Friday, somebody get ahold of Dick Tracy and Commisioner Gordon <nudge nudge a wink's as good as a blind bat, know what I mean?>

Later.

Ben,

I bought an HQ-180 without a clock. If you'll do a google search on Hammarlund clock, you'll come up with a site which has two versions of the Hammarlund clock face. You can print it on photo paper. I bought a 24-hour movement from an internet site. Your choice of hands is included. It doesn't turn anything off or on but it looks sharp and all I'll have to do is change a battery every couple of years.

This has been discussed quite a bit on the National users group
reflector.
In a word - no...

Some, including an engineer for Svetlana, have tried the 4CX800A
conversation and most have said that it was more trouble than it was
worth since the plate choke, sockets and tank coil have to be
reworked.

You can find lots of 8122's these days on eBay. Someone is selling at
least one set a week on there wth typical going prices of around $135
to $175 a pair. That's pretty cheap. A conversion to 4CX800A's with
the socket costs, etc. will cost you more than that.

Using that scheme, I've now got 4 sets of spares for my 2 NCL-2000's.
One set was found at a local hamfest for $175 brand new in their
original boxes. The other tubes were bought via eBay.

With all of the military and maritime transmitters than have been
built using the 8122, lots of tubes are hitting the surplus market.
The 8122 isn't really rare and is still in production by Burle and a
Chinese company. Yep, the Burle ones are expensive and the Chinese
ones aren't giveaway either!

Yes, everything changes. And unmoderate groups succomb to commercial
pursuits quickly - and spam gets in even quicker.
However, even just last year I bought some nifty tubes and HRO coils from
guys here.
But yahoo and qth.com has the moderated groups for discussions.
2 cents worth.

Hi All,
Phil, I don't think you're entirely correct there. I have found a number of interesting things on this group. Information, related stories, advice, it's all there. I personally use the board as a FS site too, but I really DO try to keep it to a minimum. What grates on my nerves are the folks that post ENDLESS FA ads here, touting their wares (largely common stuff) on ebay via this group. I have only done that once or twice, when I had a pretty rare item and wanted the maximum exposure. Some folks keep away from ebay and wouldn't ever know the item(s) were available if not for FA ads. I usually try to offer thing up here FS before heading to the ebay site.
rgds,
Mark S.

Source record: 12451

Sure, I'm exaggerating some. You know what I mean, though. It's depressing if you have been away for a while, then dial in and see a screen full of FA SPAM. It's hard to believe there's anyone reading this newsgroup who's too ignorant to go to eBay and search for whatever they're interested in, or just browse.

I certainly don't mind the occasional FS post, especially from a regular, or a WTB, WTT, etc. That's all in the spirit of groups like this. (Come to mention it, I'm still looking for a working S-meter for a Hallicrafters SX-28, hint hint.)

Like you, I have found this group a great source of information over the years. I still wish the signal-to-noise ratio could get back to where it once was.

Anyway, that's life in an unmoderated newsgroup, as YT noted. I guess I should be grateful there's not more SPAM here for junk jewelry, fat-burning potions, and erectile dysfunction pills.

Source record: 12459

Looking for AM transmitters of the type used for broadcasting. Want something in the 500 to 2000 Watt range. Must be all solid state. Typical examples include: Harris SX-1A, Gates One, Armstrong 1000B, Omnitronix AM 1000A, etc.

These may not be "vintage boat anchors" yet, but perhaps they can be found associated with such gear.

I suspect the best place to find one may be at radio stations who are surplusing gear. Could use some advice on how to contact them.

Any ideas will be appreciated. Please reply online as my Google email address is no longer valid.

2011. Wanted - panel meter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-05-05 01:39:11 UTC
From: Edward Greeley <etgreeley@earthlink.net>
Message-ID: <31y6g.6962$An2.2760@newsread2.news.pas.earthlink.net>
Source record: 12461

Good evening all,

I need a replacement meter to complete the restoration of a nice old RCA-Rider "Chanalyst". A good take-out from a Chanalyst would be nice, but probably too much to hope for. The meter is 0-1 ma., three inches square, with a special scale, made by Roller-Smith. I could use a 1940s vintage Roller-Smith meter and put the scale from the toasted meter in it. I imagine that a three inch round Roller-Smith would do just as well as long as the movement is good. The movement out of a round meter should be the same as the square one of that vintage and I could put the whole shebang in my square case.

Please check your stash of goodies and see what you have. I'll pay a reasonable price, of course.

BTW, if anyone cares, the Chanalyst is a rather elaborate signal tracer with a built-in VTVM.

Thanks for reading,
Ed Greeley

Svetlana in California converted my old NCL-2000 to their 4CX400's but it was a major task. The RFC choke has hot spots on several bands and they had to build a separate sub chassis for the tubes. I heard they also tried a single 4CX800 in another NCL-2000.

There are two off shore copies of the 8122 beside the original RCA versions. I had a pair of the off shore tubes in a Hallicrafters SR-2000 and they seemed to work fine.

8122 and the off shore version are available right now some at reasonable rates. The thing that needs changing is the relay and the RFC choke. Svetlana had my old amp working on 80 to 10 including 17 and 12. I think Svetlana closed USA ops and moved 100% overseas altho they do selll thru USA companies.

One of the cheaper tubes vs. power is the old 4CX1000. It would take some mechanical work, but that is the fun part. Winding a new choke is also fun.

Why bother with SSB? It requires absolutely no skill and it's a lot cheaper to pick up the phone and call a neighbor.

The fcc ham license giveaway "exam" is a joke. The new transceivers can be operated by an imbecile monkey.

CW is all that is left of our once great hobby that requires skill, knowledge or discipline.

Long after the whiners and creeps have removed the CW requirement from the ham license, CW will remain in the growing cadre of landline dialups. And real ham operators will continue to practice their craft.

Find a good bug...you'll love it and it will be your friend for your life.

Carl

Vinton,

I suggest you place an ad in Broadcasting, and/or the other trade magazines, but please keep in mind that type-approved transmitters are intended for commercial use, and are priced accordingly.

Unless you find a bankruptcy auction and you have enough cash to compete with other broadcasters, you will do better looking for older Ham gear.

HTH.

I'm not much of a code enthusiast - but I don't hate it either.... I mean some guys love it - "I" just haven't gotten to "that" point. I'm not where near using a bug being I don't use code often enough to be that fast to need one. I still have an older fashioned key on my Kenwood for when I "do" choose to do a CW contact. It works well enough for me. However - those who have enough practice or experience to use a "bug" proficiently - well..... I've seen and heard some of those guys make them sing..... I give them credit for taking the time to gain that speed and "fist". I could too - if I did it often enough, but I don't. As it is, though I love ham, my operating hours have diminished some - due to demands of life. Maybe with my newly acquired mobile rig, I can do "some" operating on the road.

As to the new radios - the menus suck. I find that it is easier to look at the manual - see what the buttons control - put the book down and never look at it again. I hate those books which keep bouncing you back and forth to try to figure out something. I've had more people bring rigs to me to program and I tell them just forget the manual - you'll learn faster by playing..... From a friend of mine who did Yaesu manuals for a while - they're pretty much "canned" manuals. I told him, they have a lot to be desired.

The one thing I do love is to create projects out of nothing - taking parts even from scrap items and creating working items. I've built numerous items for my test bench which has saved me oodles of time after the fact. Time is

money, and the little time it took to make them and little investment - has helped me save more time in the long run and make more money. I owe "part" of my career to Ham Radio. Many have gotten jobs from the Ham Radio spectrum.

Of course - all the above is my own 2 cents. Everyone has their own and entitled to it.

2027. Help with command receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-05-06 16:34:29 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <445cd016$0$18286$4fafbaef@reader1.news.tin.it>
Source record: 12477

I have a receiver looks the same as the well known command receivers (BC-453, BC-454, BC-455), but has the following main differences:

- it is grey instead of black
- it works at VHF (108-135 MHz) instead of HF
- it has loctal tubes (14A7, 14R7, 14F7) instead of octal tubes (but has one 12A6)
- it also has some miniature tubes too (9002 and 9003)
- it is built by Aircraft Radio Corporation (ARC)
- it is marked R-13B but it should be nearly identical to the R-15/R-509, and similar to the R-19/R-508/R-507

I searched the Internet for the schematic diagram with no success. Does anyone have it and would available to make a scan for me ?

Thanks and 73

Tony I0JX

Tony, What you have is the receiver for the ARC Type 12 radio system. The military called the system the AN/ARN-30. They look very much like command sets but are not interchangeable (racks, etc.). I have all the books for the Type 12 system up to, and including, the crystal-synthesized ARN-30D. I will scan the receiver schematic for you and send it out ASAP. BTW, the Type 12 is designed to be set up for either 12 or 24 volts, via filament jumpers. 24v ARC-5 dynamotors will work with Type 12 equipment. Back to you later.

Hi All,
I need a complete set of knobs for the Philco 38-10. It is a small wooden bullet set, it has the 3 regular (circa 1938) Philco knobs on the bottom row and the 2 part Philco knob on top with the knob and skirt type assembly. Originals or reproductions will be fine. Anyone know where I can find these?
rgds,
Mark S.

It may be similar to the built-in speech processor that they used in their
DSB-100 transmitter back in the early 1960s. If so, that unit, as you
describe it, was quite effective for its day.

- it is marked R-13B but it should be nearly identical to the R-15/R-509,
and similar to the R-19/R-508/R-507

I searched the Internet for the schematic diagram with no success. Does
anyone have it and would available to make a scan for me ?

That also had a companion transmitter that was, I believe four channel tall
controlled. I had a pair, or still have buried in the garage that I was
going to convert to 2 mar AM, 30 or so years ago.I think the final on the
TX was a 5763. I will see if I still have any schematics on them.

Leanne W1WXS
former avionics person among other things

I hope to find a unit at a reasonable price. Some of the transmitters I listed originally sold new for less than the cost of a decent piece of test equipment; so wouldn't expect used ones to be very expensive. Bear in mind I am looking at "low power" models, not the high-power behemoths. Don't know any hams who really want to output 50 kW, although I do suppose it would serve to keep winter snow off the roof.

Radio stations have been known to simply scrap their old transmitters as they upgraded to later models. Not much demand for the large older units. The situation might be different for FM broadcast transmittters though.

have
kept me out of ham radio but, I'm proud to have my Amateur Extra licence,.as
a result of one of those "giveaway joke exams" and greatly reduced cw
requirements. I'm still struggeling with cw, but I'm enjoying fixing up
whatever old boatanchor I can find a bargain on. I hope there's some skill
in that. I doub't that I'll ever
buy one of those newfangled, do everything, radios that's smarter than I am.
CW does seem to me to be part of the heart of ham radio but some of us
aren't well wired for it.

I am the poster child for that. I tried for 29 years to learn morse code, even to the point of taking a key and oscillator on the train in the morning and talking to myself in Morse code.

I tried every possible course that I could get my hands on and none worked until I tried Code Quick. It was the best $50 I spent on ham radio.

The fastest test I took was 13wpm, because I have difficulty writing at the same time I copy and can't really touch type. At my peak I could copy 35wpm.

To be honest, I no longer use it and can only copy around 10 WPM now.

Geoff.

Perhaps my prose was strong. But then again, we CW guys learned from the "masters." The anti-CW group has bashed the hell out of us for a long time. It is time we CW...we REAL hams...take the gloves off. If the anti-CW group feels it unnecessary to be polite, then neither do we. I'm only returning some of the magic that the no-code morons have got away with for too long.

Oh yes, Gil...and one other thing. When you find the bug...if it is a Vibroplex...buy a device from Vibroplex called a "Bug Tamer." It extends the effective length of the pendulum and makes slower CW so much more easy to send. I've been using one for 5 years and am often asked if I am using an electronic keyer. Good product.

DON'T FORGET> The NEW date is Saturday May 20th.
Less than TWO WEEKS away.

Yes we know this is the same day as the Dayton Hamfest,
there's nothing that can be done about this year.

You can find detailed driving directions on the CC-AWA web
page at http://www.cc-awa.org

As always with our Saturday events, admission is FREE,
vendor setup is only $5.

If you've never attended one of our Saturday morning events
before please understand that these events start early and are all over
before 12noon.

The park officially opens the gates at 8AM, but folks are usually
there by around 7AM.
If you sleep late and show up at 10 or 11 all you'll get to see is
the early birds packing up and heading home.

We look forward to seeing everyone there.

You are quite correct. The Type 12 included two, 5-channel transmitters in the VHF region and transverter for the MIL UHF band. The receive output of the transverter went to (of course) the VHF receiver. I'll also add that one earlier Type 12 receiver went from 118 to 148 MHz. At my peril, here's a basic list for the Type 12:

R-10A receiver 520-1500 kHz
R-11A receiver 190-550 kHz
R-15 receiver 108-135 MHz
R-19 receiver 118-148 MHz
R-20 receiver 75 MHz (Mkr Bcn)
T-11A/b Trans. 116-132 MHz 5-channels
T-13A/B Trans. 132-148 MHz 5-channels
TV-10 UHF Transverter 228-258 MHz (8-channels in any 4 MHz wide band) rx output to R-19 receiver (tunable).

ARC made a "Gonset" type portable package as one of the first FAC radio sets. The later ARN-30 and 30D sets were used for VOR/ILS in acft up into the late 60's. The ARN-30/30D included a B-10/13 VOR/ILS converter and the IN-10 VOR/ILS indicator. There were probably over 25-30 different control boxes associated with the Type 12 series radios, never mind the endless custom variations done by the ARC factory installations group. Cessna Aircraft's acquisition of ARC ended ARC's renowned quality....

One last comment, there was a genuine ARC-5 or SCR-274N receiver that tuned the VHF aircraft band. It had the standard ARC-5-type front panel dial, etc. They are rare as hen's teeth. I saw one in about 1959 and none since!

Pic on A.P.B.R.

Picked this spark xmtr up at the local ham flea market this weekend and wonder if anyone can identify it.
It looks like a key was part of the front and it is missing the actual key.

I presume in the bottom there was plates for a capacitor but am open to the thoughts of others.
It looks to have been commercial and I wonder if anyone has any thoughts on who made it.

By the way if you have really sharp eyes you will notice the price is $12.00. The individual selling it is a friend and when I pointed out I thought it was worth much more, he gave it to me !!!

Thanks Jeep,

continuing to browse the Internet, I found some pages stating that my R13B is equal to ARC type 12 receivers, others to type 15.

Anyway I believe that differences are not great, so, provided the tube set is the same, any diagram would do.

Presently I am stuck, as reverse engineering the diagram from the circuit would be way too time consuming.

Thanks and 73

Carl, I think the spark coil with the spark on top and the interrupter
is old, most likely mid teens. I just happened to have been looking
through some of my early wireless catalogs just this AM and
there's lots stuff that looks like this.
As far as the base and remains of a key, I'm not sure.
The bottom key contact that's still on the board is not part
of a spark key, the contact is way to small.
The work is clearly old, may have been put together many years
ago, but I'm not sure it was ever used as a working spark transmitter.
If I run across a catalog listing for a spark coil I'll post a pic of it.

A friend of mine has a 32V3 with chirp so bad that CW on 40M is almost unusable- higher bands are even worse.
He said he has tried changing osc. tubes with marginal success- is there a known problem/fix for this? He said he knew of others with the same problem. Hard to believe they left the factory like this.

Tnx,

Dale W4OP

Picked up a Karr Engineering p.s. for free (abandoned in one of the barns) at Hosstraders.

I am interested in learning what transmitter this paired up with. I have some use for it, but as I
like to help complete sets, I am willing to part with it for a reasonable price - warning, it is REALLY rusty.

I was wondering if anyone knows anything about a Shure Brothers Inc.
microphone model # DY30
It is a very nice looking mike but I have found no information on it
anywhere on the internet.
If you do know anything about it such as vintage, value, etc. it would be a
great help.
Thank you in advance.

>One of the cheaper tubes vs. power is the old 4CX1000. It would take some
>mechanical work, but that is the fun part. Winding a new choke is also fun.

Now that would be a *lot* of mechanical work as the 4CX 1000 (at 4.8"
tall by 3.37" in diameter) is a lot larger than the original tubes in
both girth and length. Even the 3CX800 is a fair amount larger, but a
whole lot more rugged. With zero watts grid dissapation a lot of
4CX1000s have gone to an early grave from a slight oops! <:-))

Of course that brings the choice of staying a tetrode amp with low
drive or going GG. My preference is the 8874, but they are
expensive. I keep hoping they last for ever in my old 76A.

The tubes are worth more than the whole amp.

I have a 22-year old Icom 02-AT that has worked reliably until now, when it ceased putting out any transmitter power whatsoever.

Shall I assume the obvious, that the final (amplifier) transistor has blown? (They're easy enough to replace in most radios.) Or is there something else that's known to fail in these (particular) radios that results in a loss of transmitter power?

And can anyone please tell me the part number of the power device used in the final amplifier? Thanx.

Does it still receive correctly?

What usually happens, is the synthesizer quits, and it stops sending,
or receiving.

The output transistor is a T05 (TO39) type package, and is soldered to the
metal frame that surrounds the radio. It is very special, in that the case
of the transistor is connected to the emitter. Most transistors in that
package have the case connected to the collector. This is done so that they
could run the emitter grounded (as is usual) and not need any insulated
heatsinking hardware.

The usual way of blowing the output transistor in an 02AT is to use a battery
pack that supplies more than 9v, or to try and power the rig directly from
your car battery. ISTR that a short on the antenna is a third way.

Well, it is an induction coil for generating a spark, but for it to be
any sort of transmitter, (except for just a noise generator) it needs to
have an RF tuning circuit coil(s)/capacitor(s).
There were induction coils similar to yours used for the spark ignition
on really ancient gasoline engines. Sometimes there was a "safety" gap
(spark gap) provided to keep the fire from jumping around inside the
induction coil if the "high tension" output lead to the engine's spark plug
(the load) became disconnected.
I've never seen an induction coil with such a well built spark gap used
as the "safety" gap.
To make it clear, I sure don't know what you've got! (should have kept
quiet in the first place)

Hello,
My question is off-topic for this group but I know there is a lot of
expertise here.

Is my Yaesu FT-817 an "ND" or not? No where on the rig does it say "ND"
(only "FT-817") but it came new from the dealer with a manual for the
"ND". The s/n is 5K040047. How can I tell for sure what it is?

Thanks.

Source record: 12416

Here again is my semi regular wanted posting for a very special radio knob.

http://radioheaven.homestead.com/grknob.html

This type of knob was commonly used on early 20s Leutz super-het kits sold by the Experimenters Information Service.
The knob is a combination of a large General Radio main knob and a 4 inch numbered skirt installed at the E.I.S. shop.

I now need only ONE of these knobs to complete a Leutz super-het restoration project.

I will gladly pay $50 for the correct knob in good condition.

PLEASE check your junk boxes and see if you have any of these knobs laying around.

Thanks & 73,

Ron

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/219981

Topics discussed in SolderSmoke #21:

-- Mike's new 80 meter homebrew rig
-- PSK 80 Warbler
-- Balanced modulator's: K2's '602 circuit
-- Bill's direct conversion receiver -- sweet sound
-- Verticals, slinkies, Bill's London antenna woes
-- Barbados receivers
-- Voodoo and RF amplifier construction
-- Tiddly-Wiki, VMWare, AFUKnoppix
-- Low Pass Filters
-- Barcelona SolderSmoke video
-- Telescopes & First Light for QRP rigs
-- MAILBAG: Alan, W2AEW; Nigel, M0NDE

Listen at: http://www.ourmedia.org/node/219981
Background:
Tired of listening to Led Zepplin or NPR on your
I-Pod? Wouldn't you like to be able to carry with
you the kinds of ham radio conversations that you
listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in
London, England meet regularly on the ECHOLINK system
to discuss their homebrew radio projects. We are
making them available as PODCASTS.

You can subscribe to the program, have them downloaded
to your MP-3 player, and listen to them at your
convenience. To subscribe, just cut and paste this URL
into your I-poder (or similar) software. (There have
been some problems with this subscription URL.)

http://www.ourmedia.org/user/36170

If you don't have an MP3 player you can just go to the
site below and listen to the latest program (and
earlier editions) using the audio software on your
computer.

http://www.ourmedia.org/node/219981

Here's the homepage for our show. All our programs are available here. There is also a blog and links to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

Maybe the OP was thinking of the older IC-2A. One of the battery packs for the 2A had a jack for connecting 12V to it, which allowed you to run the radio off the battery while it was being charged. Applying 12V directly to the radio (only possible by removing the battery pack) would fry it.

The IC-02A could run off 12-15V directly through a jack in the top plate.

At the risk of going off topic, I recall someone mentioning that the RS 2 meter portable had an issue almost the same. The jack at the top was "supposed" to be for "vehicular" power - but I heard horror stories of the radio suffering damage when used in just that fashion. IAnd I've seen first hand - a battery pack that got smoked using vehicular power. It almost caught the guy's car on fire since it was near "cloth". I haven't looked at either the radio or schematic for so long - I can't recall exactly what the make-up is. I have though - heard many tales of guys blowing out radios in a vehicle. Hell, our Fire Department Squad Truck radio went out twice in 3 months from similar issues. I'm not sure if they actually figured out the exact reason as yet - Motorola and the original installer were to look over the situation. Seems to me, we all need to take an extra step to prevent such things from happening, since we can't rely on the manufacturers to do so. Just my 2 cents.

OOPS! The 02AT is ok on 12V, the 2AT has a problem with above 9V.
Sorry for the confusion.

I had a 2AT battery pack catch fire when charging off of the car charger.
There was no fuse in the power cord, and a wire shorted inside the pack.
Poof! It ate the wires inside of the pack, and the power cord all the
way back to the lighter outlet. A fuse would have been a *really good thing*.

> battery
> pack that supplies more than 9v, or to try and power the rig directly from
> your car battery. ISTR that a short on the antenna is a third way.

...the jack on the top's supposed to have an internal regulator, and I've used it in my truck on occasion since the radio was new with no negative consequences (not like the HTX-202, which was made by Maxon under license by Icom for Radio Schlock, and had issues with its external power-jack).

Maybe infrequent long-winded transmissions over the last 22 years is the culprit for the transmitter's untimely demise? (It's kept my hands warm in the cool outdoors more than once.) I've long since misplaced (or

lost) the original manual, which had a schematic.

If I crack it open, I should be able to measure the voltages on the device, itself to see if it's blown. Right now, the final seems like the prime suspect. Thanx...

...Dave, N6BHU

Yeah, I've had a few experiences myself, in years past that taught me
there's no such thing as too many fuses.

My glove-compartment has an assortment of fuses of varying vintages, all
acquired for that "rainy day" that some times never comes.

It would not surprise me much if the failures were due to a "load
dump" event.

If the alternator is running, and supplying a substantial amount of
current to a load (e.g. headlights), and the load is suddenly
disconnected (e.g. headlights turned off), it's not at all uncommon
for a very impressive voltage spike to be generated. This is due to
the same sort of inductive "kickback" which can occur when shutting
off the drive current to a motor or relay or solenoid.

My recollection is that the standard used in the automotive industry,
is that electronic devices on a "12-volt" automobile bus should be
designed to survive load-dump spikes of up to 50 volts. A radio
designed for 12 (or 13.8) volt operation, whose finals are fed
fairly directly from the battery supply, may work just fine if the
ignition is off, but could easily fail on its first load-dump event.

Some sort of fast-acting zener protection, followed by an RF choke,
would probably be a good idea when connecting such radios to an
automotive power system.

Unfortunately, a 50-volt load-dump spike could exceed the input-
to-output voltage-differential limit of common regulators such as an
LM317; hence, even if you're using a regulator of this sort to power a
radio intended for 9 volts, you'll probably need an upstream zener to
keep the regulator from popping.

Very (perhaps highly) plausible theory -- it's too bad that Icom didn't
learn from Motorola, and create an inexpensive (relatively to their
radio, anyway) vehicular charger for their radios (e.g. 'Convertacom'),
rather than a (potential) built-in self-destruct device.

Hi Dave,

The I was thinking of the 2AT when I penned my response. The 02AT
is quite different. The synthesizer is more integrated, and there
aren't nearly as many crystals as in the 2AT. I am not certain what
the 02AT did for a final.

Assuming it is the same as the 2AT, it is a fairly simple job. You do need a
high wattage soldering iron, so you can solder the transistor quickly.
You should be able to make a few measurements, and determine if the
final is popped.

The 32V transmitters have a silent oscillator... the oscillators
run all the time and are not keyed. Stages downstream of
the oscillators are keyed.

This was to eliminate chirp.

My guess is that some shielding is not working and the chirp
is caused by major feedback. Another possibility would be
the tube that regulates the voltage to the oscillator. Bill Hale K0QA

Yup. I also had a 3A and had to be careful about that.

I know the Icom batteries I bought with and for the 02AT had a resetting
thermal fuse inside, wired in series with the pack. I used those batteries
with the 3AT; don't know if they originally had different batteries.

Yep, but that doesn't help much when the circuitry fails between the connector
and the thermal fuse. Besides, the thermal fuse would only open if the cells
in the pack got too hot... not the 24 gauge wire.

Did you want the Heathkit for a collection, or to use?

The reason I ask, is the Heathkit is an emissions tester, and as a result, doesn't actually test anything but the cathode of the tube, and to check for shorts.

Any of the Hickok machines would be a much better choice. They are all dynamic mutual conductance (Gm) testers... (But then, with a used Heathkit, you do get the added advantage of having a unit that was soldered by a hobbyist;-)

So *that* explains the high prices of the unbuilt Heathkit projects on eBay!

Truly things /are/ stranger than we can imagine.

The Carolinas Chapter of the Antique Wireless Association
will host our "Spring Antique Radio Swap Meet" next Saturday
May, 20th 2006, at the North Carolina Transportation Museum
"Spencer Shops" located in Spencer, North Carolina.

Spencer is located just off I-85 a few miles north
of Salisbury, NC.

You can find detailed driving directions on the CC-AWA web
page at http://www.cc-awa.org

As always with our Saturday events, admission is FREE,
vendor setup is only $5.

If you've never attended one of our Saturday morning events
before please understand that these events start early and are all over
before 12noon.

The park officially opens the gates at 8AM, but folks are usually
there by around 7AM.
If you sleep late and show up at 10 or 11 all you'll get to see is
the early birds packing up and heading home.

We look forward to seeing everyone there.

73, Ron kc4yoy

My favorite would be the 539C. It is well sought after, so the prices
tend to be high. The 539 A and B are great too, just older. The 750,
and 752 are nice too, as is the 600.

For a complete list with some history, try:

http://6007.us/

Take a drive to southern Ohio and go to the Dayton Hamvention. Not
dedicated to strictly old radios, mostly Ham Radio gear, but still alot
of good stuff to find, tubes, parts, and yes some old radios.

This is just a Saturday morning swap meet, when the vendors
sell out they go home. Even the best flea markets are only
good for about 3 or 4 hours.
After that everyone is just standing around.

Please feel free to link, bookmark, and send feedback.

Topics discussed in SolderSmoke #22:

-- Mike's RF amplifier struggles
-- Good RF citizenship: Bill installs LP filter
-- Loads and power out in RF amps
-- Bill's amazing UK hamfest (rally) adventure.
-- Fun with lasers and UV
-- Doomed to build a Binaural receiver
-- Website update, Google and Amazon ads

Listen at:
http://www.ourmedia.org/node/223906

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

NEW RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software. We've been having trouble with our Ourmedia RSS feed, so Mike (software wizard that he is) has homebrewed his own RSS feed. In order to subscribe to SolderSmoke, point your podcast software to:

http://kl7r.ham-radio.ch/soldersmoke.rss

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/223906

Here's the homepage for our show. All our programs are available here. There is also a blog and links to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

73 from London
Bill M0HBR N2CQR CU2JL

Drake R-4C with all filters and noise blanker.
Plays and looks nice. Will look great with your collection!!!!
If interested, I have the Drake TX-4C and power supply with cabinet
and speaker, Plus the classic Heil desk microphone, looks like the old
RCA box microphone. Nice setup.
Please make offer, ready to sell.

The ZM3 is a great instrument useful for testing value, checking leakage and forming electrolytics.
Built very tough. even has a pass tube for the variable DC supply.
Every bench could use one of those.

> Yes, drown them both.
Insofar as that comment is concerned, that is exactly what the ZOG would like.
The liberal is a mindless automaton tool of the ZOG.
Unconsious if not blind to the ZOG 'world view' and unaware that they are being manipulated.
On the contrary, the liberal revels in destruction of tradition, in the home, in traditional marriage, the Christian faith and of course an absolute antipathy toward anything that is 'white.'
The ZOG IS the root of all evil
Die ZOG, die
Die liberal die

God, are you stupid.

Monotheism is a three headed poisonous snake of Semitic belief. WHITE
people are by nature pantheistic or polytheistic. Liberalism is
JudeoChristian in nature: proud pagans had no truck with it.

Read your own guru Dr. Pierce sometime. I don't mind bigots, but I
can't stand stupidity.

My plans to go to Dayton got snafued.
I have 3 flea market space tickets, 3 entry tickets and one courtesy parking pass, spaces 3744, 3745 & 3746. They're near gate D at the north end. I paid $330.00 for the set and I'll take $220.00 by Paypal & I'll overnite them to your location of choice or you can pick them up in Tulsa, OK.
tnx

2138. EA53 tube for HP410B VTVM?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-05-17 02:33:03 UTC

Does anyone know where these might be available for a "reasonable" price? The cheapest I've found them for is $45 for a used "pull". I have a nearly new 2-01C in my ME26D/U but that won't fit in the probe in my HP410B. As I understand it, some 410B probes came with 2-01C diodes and some came with an EA53 probe and the two are not always interchangeable.

Thanks,

Barry - N4BUQ

$45 for EA53 is reasonable price, the tube is rare. HP initially
rolled out 410B VTVM with 2-01C based AC probe but the contact with the
tube in the probe was unreliable, customers complained, and HP
eventually converted the probe by supplying overhaul kits for EA53
tubes.

Contact me off line, I have EA53's, 2-01C's, conversion kits for EA53,
and the probe assembly for 2-01C so I may be able to help you.

Have you considered a silicon diode and a filament resistor? I know it
isn't original, but it will work just fine.

Actually, no it won't.

The tube in the AC probe is very special. It extends the frequency response
from 20Hz to 750MHz, and up to 300VAC from 20Hz to 100MHz. You won't be able
to do that with any single solid state component.

-Chuck Harris

Chuck's correct on this. I used 410Bs for years, and what he says is
absolutely true on this probe. The tube is a "must have" in order to
restore full functionality to this meter. Messed up probes are the #1
reason than many otherwise good 410Bs get junked, which is a shame.
It's really a very versatile, accurate instrument when functioning
properly.

Does anyone care to comment on the differences between the ME26D/U and the HP410B? I have both and by far prefer the 410, but I wonder if my ME26 is working properly. It was a NOS meter when I removed it from its box a couple of years ago and looks nearly new; however, measuring AC with it isn't nearly as "pleasant" as my 410 was. The meter is very "jumpy" and overloads on the lower ranges simply by picking up the probe. It settles back down, especially when the ground clip is attached properly to whatever is being measured, but I don't remember the 410 acting like this. Is this due to the 2-01C or just different components and construction methods between the two models. The ME26 is supposed to be the militarized version of the HP410B, but it does seem to behave differently.

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 21st 2006
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and

2147. Johnson Viking 6N2 Thuderbolt Amplifier Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-05-18 01:17:29 UTC
From: Hosta Bevie <hostas@earthlink.net>
Message-ID: <JWPag.343$SX5.284@newsread1.news.pas.earthlink.net>
Source record: 12297

The unit I have has the fuse holders busted up, and before I go through the hassle of replacing them (working through the LC filters attached to them) I'd like to know if the originals were bayonet or screw-in caps. I'm thinking that the HF Thunderbolt amp probably used the same types, so that info may be of use as well.

adTHANKSvance,

Mark

I don't know - that is the thing...

I've pulled off the largest transformer (reasoning that it would be the HV xmfr) and measured a step-up to ~2.4 kV. I think this was a power supply for a Kaar transmitter; I don;t recal any power supplies from that era being built for a variety of transmitters.

BTW, still available.

David Goncalves

I actually hadn't heard of a Kaar transmitter until this.

Third party supplies were available to run several transmitters in the late 50s and early 60s. Actually most any tube power supply will run almost any rig with a cable change for transceivers and twins of the era. They all used 6.3 or 12.6 V heater circuits-usually rigged so either would work so the box could go into a 6 or 12 V car-usually250-300V for the primary B+ and 600-800 for the final plate supply. They were also used for some PA equipment and by CB "home"brewers for linears-actually they were usually TV repair guys or even hams working out of their basement, because CBers have low IQ so frequently-quite common even when I was a youngster during the "Convoy" boom. I turned down a job at minimum wage at a TV shop when I figured out I would wind up spending all my time assembling these things instead of working on TVs. Six weeks later the joint was raided and the FCC smashed every goddamned piece of test equipment in the shop whether or not it could be used for CB, legal or otherwise, along with his inventory, test fixtures, everything that wasn't a TV.

FWIW you see third party supplies in ads in the ARRL Handbooks in the JFK/MM era or thereabouts. Most were for mobile operation but some were three-way-low volt DC, 110 VDC or 110 AC.

I have a nice TenTec Paragon Model 585 Transceiver for sale. It works great
and looks very good. It was back to TenTec in November of 2004 for a
complete going over including installation of a new
Main Tuning Encoder. It also comes with the original manual in a loose leaf
notebook.
A few minor scratches and nicks but overall in near Excellent Condition.
Digital pictures available
on request. Thanks, $625 shipped in lower 48. Charlie Hugg, K5MBX

2153. Hallicrafters/Echophone Query

I recently acquired a Hallicrafters S-39 Sky Ranger receiver at a local hamfest. Its in as-new condition, which is why I decided to get it. I recall I once had either the earlier version of this one or maybe it was another S-39, I don't recall. My question is, looking at this rig, and considering the form/fit/function of Echophone rigs, did perhaps Echophone manufacture these particular Hallicrafters receivers? I recall there was some sort of co-production and/or cooperation between these two companies. Thanks de K3HVG

Source record: 12305

Bill Halligan bought out Echophone in 1935 and started making Hallicrafters radios in the old Echophone factory at 2611 Indiana Ave. in Chicago. Before that, Hallicarfters gear was made under contract to the likes of McMurdo-Silver, Howard and others. Hallicrafters used the Echophone name on several low-priced receivers in the early to mid-1940s. The Halicrafters S-41 and the Echophone EC-1A are the same radio with different paint jobs. Your S-39 was made by Hallicrafters. The older version of the S-39 was the S-29.

I have a S-39 with a bad dial scale. I sure could use a good scan of a clean dial. Got the S-39 playing well, but it doesn't look good with that bad dial. Most of the band-4 scale has rubbed off.

"Messed up probes are the #1 reason than many otherwise good 410Bs get junked, which is a shame."

My response might offend the purists, but I can defend myself by stating that I am just an amateur.

I hate throwing things out. And, I hate spending money on parts that cost more than the instrument. So, if I had an HP 410 that had a bad probe and I did not wish to invest in a new tube, I would find a tube that would fit into the probe and used the appropriate filament voltage. Even a triode can be used as a diode. The fact that the fitting of the tube might destroy the frequency response may not be a big factor. Heck, we usually only operate up to 450 MHz. Even if the calibration is not absolutely correct, it can be tested easily with a signal generator and calibrated with a calibration chart. What you end up is a bastard HP 410, which is still better than a broken one.

I must admit that I have bastardized a lot of things instead of throwing them out. Some of the stuff I have works better than when it left the factory. Some does not. In each case, I have outsmarted the trash man.

2167. Dentron MLA-2500 Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-05-19 23:19:47 UTC
From: JC <jcandela@prodigy.net>
Message-ID: <nosbg.73670$_S7.36849@newssvr14.news.prodigy.com>
Source record: 12317

Hi Group,

I have a 2500 that had one bad 8875, and as-is EBay buy, and I am in the process of a conversion to a single 8877. This may not be the best choice of a tube for the application, but I had a good one in a box for nearly 20 years, so I decided to give it a try. Before the conversion I powered it up, and with one tube I could get 450 watts on 80M with 50 watts drive. I did notice however that the variable loading capacitor had to be at full mesh on any band I tried. I blew off that issue because with only one tube the PI-Net was not seeing the as-designed input impedance.

My question is from my blurry schematic and parts list. The fixed Centralab loading capacitors in my rig are all 1000pf, and the fixed plate tuning side capacitors are all Centralab 100pf units. The parts list does not show any 1000pf HV Centralab capacitors. Is there a typo in the parts list, or does my amplifier have the wrong capacitors installed in the loading area?

I powered up the amplifier last night, and I can get 600 watts RF out on 80 meters with 50 watts drive. The cathode current reaches 0.8 ampere at 1700 volts Plate. So that is 1360 watts in for 600 watts output. That is about 44% efficiency. The variable loading control always wants to be at maximum mesh for maximum RF output. On 160, 40, and 20m meters the loading variable capacitor must also be at maximum mesh. This makes me think my PI-Network is not correct for the impedances involved, and then it sure appears that the Dentron documentation does not match my rig. I might have to reverse engineer that PI-Net.

So does anyone have a better set of drawings to see if their MLA-2500 PI-Net parts match the drawings?

Regards,
Jim

2168. Re: Dentron MLA-2500 Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-05-20 17:13:42 UTC
From: JC <jcandela@prodigy.net>
Message-ID: <a7Ibg.11467$fb2.6663@newssvr27.news.prodigy.net>
Source record: 12318

Update:

The fixed loading capacitors on the MLA-2500B for 75, 160 meters are both 1000pf per Dentron parts list whereas they are 100pf on the MLA-2500 parts list. It looks like a typo in the documentation. Then I measured my 1000pf capacitors in my amp, these both measured about 820pf on my capacitance bridge at 4 Mhz. For sanity sake, I also measured a 820 pf silver mica capacitor, and the bridge read 850pf @ 4 Mhz. So it seems that I uncovered two problems:

* Dentron MLA-2500 parts list has typos in it

* My two loading capacitors for 75 and 160 are out of tolerence on the low side. This explains why my variable loading capacitor needs to be at full mesh.

Anybody have a 8877 Teflon chimney they want to get rid of?

Jim

2169. Re: Dentron MLA-2500 Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-05-20 19:39:04 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <446f705a$0$36922$4fafbaef@reader3.news.tin.it>
Source record: 12319

It is unlikely that the fixed loading capacitor is as high as 1000 pf, except for 160m. However if Dentron has really used a Centralab 1000-pf capacitor as fixed loading capacitor, that is a sign of bad design, because those capacitors are not suitable for that purpose.

As a matter of fact the Centralab 1000-pF capacitors use a different ceramic material than the 100 pF units, and they therefore have a very different behavior, as explained below:

- the 1000-pF units can withstand high RF current, but cannot withstand high RF voltage at the same time (DC voltage does not matter). A more rigorous way to express that concept is to say that the 1000-pf units cannot withstand high "reactive power" (reactive power = RF current times RF voltage). In practice they are only suitable for bypassing or plate-to-pi coupling (high RF current but very little RF voltage).

- on the contrary, the 100-pF units are suitable for operation in resonating circuits, where both the RF voltage and the RF current is high (= high reactive power). So they are suitable as fixed loading capacitors.

If one uses a Centralab 1000-pF capacitor as the fixed loading capacitor of a high-power linear, the capacitor will heat up and change its capacitance, so detuning the circuit. Prolonged high-power operation may result in capacitor failure.

Tony,

I appreciate the comments. For sure there is something awry in this pi-net. I looked at your tutorial on your web page, and wow, you know your stuff!
The schematics of the 2500, and 2500B are at the following link:

ftp://bama.sbc.edu/downloads/dentron/mla2500/

Another aspect of this pi-net is that the tank coil consists of tight wound silver plated stranded Teflon insulated wire of about 10 awg. Users of healthy 2500's report 1100 to 1300 watts key down (output), and 1500 watts PEP out with a pulser. This is very good for the size and weight of this amplifier.

The loading variable cap is about 50-500pf with a 100pf Centralab in parallel with that. The bandswitch is not a shorting type, so it adds 200pf on 40m, 1000pf on 75, and 1000pf on 160 (all on 2500B schematic and parts list). These do not add up due to the type of rotary switch used. I'd prefer a shorting switch arrangement where on 160m, all the fixed loading caps are in parallel and each unit has less capacitance.

I will look more carefully at the capacitors used to see what the part number is. Maybe the correct values are in there, but of the wrong type. I plan to use my impedance bridge from the 50 ohm amp output looking into the amp, and replace the 8877 with the calculated plate load RL going into the pi-net. Hopefully a 1/2 watt carbon comp resistor around 2K (a guess) will represent the plate side impedance. My hope here is that I can evaluate the pi-net 160-10m at a low level (0dbm?) to see what the impedance matching capability is. Maybe the values used are correct, but with high power, the capacitors get lossy (hot), drift down in value, and cause the efficiency of the amp to really stink.

I'll let you'all know what I find.

Thanks,
Jim

2171. Replacement Transformer for Hallicrafters SX-42

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-05-21 02:49:08 UTC
From: jjbunn <julian@cacr.caltech.edu>
Message-ID: <1148179748.423888.118780@u72g2000cwu.googlegroups.com>
Source record: 12321

I'm looking for a replacement, or a substitute, mains transformer for a Hallicrafters SX-42 ... the existing one sizzled and died :-(

The specifications are: 115V primary, 500V C.T. @ 142mA, 5V @ 3A and 6.3V @ 5.3A, and the mounting holes are 3.75"x3.00".

If anyone knows a likely source for a replacement, please let me know.

Thanks!
Julian

Try http://www.oldradioparts.com

And there's always ebay. Unfortunately old large transformers and
audiophile prices tend to go hand-in-hand but you might get lucky. I
recently found one for an 18-tube set of mine for $19. I guess it was
"too big" for audio gear :)
The Vintage Electronics category is where to look.

Julian,

Any chance the failure is visible, and fixable?

An option here is to get your tranny rewound. There are lots of folks that offer this service, or you might take it on as a DIY project. If you go this route, you could simplify the winding task by only making one winding of 250 vac, and use a full wave bridge rectifier consisting of two silicon diodes on the negative side (-) and the vacuum tube 5U4 rectifier on the positive side (+). If you go this route, you can beef up the HV secondary wire size since there will be room, and it may be easier to handle a larger wire than what was originially there. You can also modify the turns ratio to better match today's higher line voltage. I bet the SX-42 tranny was designed for 110 vac AC mains whereas today we often have about 122 vac at our outlets.

As a FYI for still working open frame boat anchor transformers, you can preserve them by vacuum impregnating them with transformer varnish. This will fill in the voids where a failure is imminent, but hasn't happened yet. This can be a DIY project where you can use car manifold vacuum, some tubing, fittings, and a suitable container. Take the end caps off first to expose the windings. If the wires have bad insulation, you can cut them 1" from leaving the core, and strip back. Add on new wires and heat shrink the connection. As for doing the varnish bit, it's neat to watch the bubbles exit the transformer as the air is pumped from the container, and then when you let the air back in, that forces the varnish into all the cracks and pores of the inner area of the transformer. Repeat two more times to get the job done. Then hang until dripping is over, and bake to cure (temp and time depends on varnish used). Instead of varnish I have also used electrical rated RTV thinned out with chlorethane until it is a white milky soup.

An option is a transformer company. Heyboer Transformers
in Grand Rapids, Michigan does this work --
you may also have a suitable rebuilder one in California.
http://www.heyboertransformers.com/

You can provide them with specifications, an the old transformer for proper
sizing -
they matched the wire colors and used the old bells on the new transformer.
Professional job on a rebuild for me late last December.

BTW, you should specify that primary should be 120 VAC --
instead of 110 V of the original - due to higher line voltages -
this should operate cooler in the SX-42.

Heyboer does nice work and I've used them but I would think they are
prohibitively expensive for this project. You'd looking at around $150
for one this size.

It may be that expensive for the SX-42 model, but the transformer for my
specific project in
December was $100 with shipping - and they had it back to me in less than
one week!

Hi, Thanks for the excellent links. I had seen the first one before. In looking at the article about the 2 times 4cx400a, it jumps out at me that this conversion leads to about 350-500 watts less RF output than original (1100-1300 versus 750-800) even when using tubes with more capability. I attribute this to running Tetrodes at low plate voltage. In this application Hi-Mu Triodes are a better choice. Also the low RF drive need for the Tetrodes make them attractive for low power exciters, and a problem for us with a 100 watt exciter.

My conversion is similar to the 4cx800 article except I am using a 8877. I use the same external box to house the socket, and mount the fan. The 8877 may not be designed for use at 1700 volts, but what the heck, I only want about 1000 watt RF output. I need a chimney like what is described for tthe PI-Network he 4cx800. Any idea where I can get a block of Teflon, and then get it machined?

That article about the 4cx800 has some good visuals of the pi-net that is being a problem with my 2500.

Thanks again,

Jim

Jim,

Bob Schetgen, KU7G machined that Teflon block in the 4CX800 article .
Unfortunately, Bob passed away on December 5, 2005.
Bob worked at the ARRL Headquarters for nearly 23 years.
He was a member of the editorial staff for the past 16 years, he was perhaps

best known as the editor of the "Hints & Kinks" column in QST.

He also served as the managing editor of the League's technical and experimenter's journal QEX.

Source record: 12331

Hi Jim,

Thanks for the super advice. The transformer died after some "fizzing",
and now one half of the primary is O/C.

I have an old HP/Paeco transformer which has several 6.3V taps, and a
5V tap for a 5U4. However, the HV secondary is for a B+ of 440V ... too
high (the SX-42 needs 250VDC). So I don't think I can make that work
easily.

Julian

Hi, I have a new Tektronix tube part # 154-0737-00. This is a CRT for scopes 564B, R564B, or TLDN64.

This is new in the original box and looks perfect.

If anyone is interested, please drop me a note.

I would suggest an alternate chimney though using Silastic rubber
sheet wound into a tube shape as is done in the Alpha series amps.
Relatively inexpensive, no machining, and easy to install.

One other comment. The MLA 2500 suffers from poor voltage regulation
as did most of the Dentron amps. It does after all use a doubler in
the power supply. So when tuning be sure to use the "tune" position
and then switch to operate. Tuning in the operate position drags the
plate voltage down so far that the amp will not be properly tuned for
the PEP on SSB. With my voice characteristics and under the old rules
of 1 KW average input mine would put out about 2200 PEP.

Good Luck,

You can purchase the Silastic rubber from Alpha directly.
It is no longer red, but black -- supplier to Alpha changed this !

Roger Halstead (K8RI & ARRL life member)
(N833R, S# CD-2 Worlds oldest Debonair)
www.rogerhalstead.com

Roger:

Yes that ia about correct for no load. I am running mine off 120 vac, and the B+ drags down to about 1600 volts at 0.8 amp load. I've seen other conversions that run off 220 vac, and they say about 1700 volts for the same load. The voltage doubler capacitors if increased in value, say 330 uf instead of 125 uf would be better. This however would require adding a soft-start turn on modification to avoid welding the contacts of the power switch, or blowing the diode stack.

I'm assuming that is in the tune position? 800 mills sounds kinda
high in the tune/CW position.

Also I was able to get well over 1500 watts PEP out of a pair of 8873s
without driving them hard.

>conversions that run off 220 vac, and they say about 1700 volts for the same

It should be just a transformer tap change for 220.

>load. The voltage doubler capacitors if increased in value, say 330 uf

It sounds like they are tuning in the SSB mode. The voltage stays
right up there in SSB so if tuned up with carrier in that mode the
tuning will not be correct for SSB.

>instead of 125 uf would be better. This however would require adding a
>soft-start turn on modification to avoid welding the contacts of the power
>switch, or blowing the diode stack.
That lack of regulation is why they run a lot more output PEP when
tuned in the tune/CW position instead of the SSB position.

Years ago I sold and worked on a lot of the Dentron Amps.

> I'm assuming that is in the tune position? 800 mills sounds kinda
> high in the tune/CW position.

The MLA-2500 has no tune / cw switch like some other Dentron's do. I guess the amps you are referring to must have a tap in the HV transformer to run 1KW DC input on CW at lower plate voltage. Is that correct? I'm sure glad this DC input stuff is past tense, and 1500 watts PEP output is simpler. Of cource the AM'ers that ran 1Kw dc input with plate modulation got their power cut back because it was legal for them to run ~ 3kw PEP output with a 750 watt carrier. I was one who did that back in the 1980's. That was a blast!

My MLA-2500 has a "Cont Duty" switch that forces the fan on high speed whenever the amp is keyed.

>
> Also I was able to get well over 1500 watts PEP out of a pair of 8873s
> without driving them hard.

Aren't the 8873's a conduction cooled version of the 8873,8874,8875 family? Those have reduced plate dissipation, but no need for a fan.

Yea, that asummes there is a 220 vac outlet in your ham shack. :-)

I still need a verification of them pi-net capacitors in the MLA-2500. It appears that the original documentation is incorrect, and so is a redrawn schematic on Bama.

Jim

It has been along time, but there was a way to tune them to get full
power on SSB. I was remembering a CW/SSB switch which aparently isn't
correct.

Most of the legal limit amps I ran at 1KW average including exciter
would hit about 2200 PEP out.

Oops! I'm talking about a new, stock, MLA-2500. Make that a pair of
8875s, The transverse cooled ones that are nigh on to impossible to
find.

I did have an amp that used the 8873s, but if you did much operating
you put a couple of fans on the heat sink.

The 8873, 74, and 75 and the same tube with different cooling.

Roger,

It aint ever easy! I'm in a ranch style house with two breaker boxes. Both boxes are full of breakers! I do have breakers for an electric stove and I have gas, and I have a breaker for a sauna, and I have none. Those come from the far away box. The stove outlet is opposite a wall to the ham shack, so that is my best chance to use that, and change the breaker to 15 amps. Still need to pull the stove, and put a hole in the wall. The XYL is not a ham!

Regards,
Jim

Another possibility is to use the filter materials made
by Roscoe for photographic lighting. These are sold in large
sheets and come in many colors. They are not expensive. The
idea of the yellow filter is to suppress the bright blue
initial fluorescence of the screen and it should not take
anything too special to do this.
Roscoe is at: http://www.rosco.com/us/ There is a list
of retail stores at the bottom.

Good luck on that tube. The early to mid 80's were very bad years for
8877 production. If you get a good tube it will last many years. If you
get a bad one it might fail in hours.

Before the conversion I powered it up,
> and with one tube I could get 450 watts on 80M with 50 watts drive. I did

Dentron always had messed up tank values. Just look at the values they
picked. They typically ran excessive Q on 160 meters and 80 meters. As
I recall Q was in the 20's on 160 in many amps they made. They had the
idea "one tank coil fits all".

The only thing that hurts is circulating currents in the tank are a bit
high and the loading control is swamped out by too much shunting
capacioatnce so it has very little range.

> My question is from my blurry schematic and parts list. The fixed

Dentron used what they could buy. How do I know? I worked there for a
short period and watched them do that. They would often make parts runs
to surplus stores in Cleveland for components.

> to reverse engineer that PI-Net.

It was never engineered in the first place. It is seriously lacking on inductance.

Be aware also the larger ceramic caps have a high temperature coefficient. While they will marginally handle the current, any temperature change seriously affects tuning.

If you really want to fix it, start from scratch.

While you are at it get rid of the carbon resistors across the filter caps. Get rid of the carbon resistors across the diodes also. Any high dissipation critical resistor should be a metal component, not carbon. If you don't change the carbons across the filter caps to metal films or wire wound they will eventually fail and take out the electrolytics. If that particular amp has small carbons across the diodes they need to be removed.

And you prove what's bad about this newsgroup.

This isn't a buy and sell newsgroup. When it was created,
there was debate about whether ads should be allowed, and
even back then (1995 or maybe it was 1996, I forget now)
it was a hot point, because the Internet was still morphing
from it's traditional ways to the sadly more commercial
arrangement.

Finally, they decided ads would be allowed, but if you check
the charter, they come way down after discussion.

SO it's bad enough that too many treat this as a buy and
sell newsgroup for old radio equipment.

But you violate that further by using it as a general
buy and sell newsgroup. And if advertising old radios is
sort of borderline, it's quite clear that ads like this one
does not belong here.

>inductance.

Jim's reply:

Tom,

Thanks for putting this all in perspective for me. Your description of the high Q, and resultant heating of the loading capacitors, and detuning makes sense. Users have reported much higher peak power than RMS with these amps. I always attributed that to the voltage doubler, and B+ sag under load. That is probably the dominate factor, but apparently RF losses are significant as well after a sustained key down at 1 KW input.

So what is your opinion about the tank coil being wound of stranded and insulated wire where the wire strands are silver plated, and Teflon insulated? They are also close wound where the turns touch each other? I have never seen that done before.

It sounds like I need to hit the charts for pi-networks, and pick the Q, and I/O impedances, and then make it happen. The inductance of that orange 160-80-40m coil with Teflon wire will be hard to model. I will try to measure it with my RF bridge, and see how it comes out (uh / 10 turns).

I have 2 large 400pf 2500v silver micas, and a strange 4 section variable mica variable where each section is 300pf. This item has a common stud, and each section is about 1" diameter, and 1/4" thick. I might be wrong, but I recall someone saying these were used in the ART-13. These capacitors should handle lots of RF current, but I'm not sure of the voltage rating of that 4 section mica variable capacitor. The Dentron 1000pf loading capacitors are CRL type 858S, 5KV, X5U. These are best for bypassing use, and have high dissipation factor, and high capacitance drift as it heats up.

Regards,
Jim

First, power you read on RF power meters is RMS power. Peak envelope power is the peak value of short term RMS power, average power is the short term average of RMS power. This is why for CW PEP and average power is the same, while for SSB and AM it is not.

The RF losses are the same between the two.

A weak power supply can cause a disparity between peak and average power, but that has little to do with the supply being a doubler. It mostly has to do with the size and quality of components. Remember when Dentron's were made the legal limit was 1000 watts DC plate input.

> So what is your opinion about the tank coil being wound of stranded and
> insulated wire where the wire strands are silver plated, and Teflon
> insulated?

That's OK. The big problem is the inductance is too low.

>They are also close wound where the turns touch each other? I
> have never seen that done before.

Cost cutting. Efficiency is determined by the ratio of unloaded Q to loaded Q, and certainly stranded wire, insulated wire, and close spacing reduces unloaded Q. Losses in the tank are reduced by half if you double overall unloaded Q, or if you simply cut operating Q in half.

It would be difficult to double unloaded Q, but it is easy to cut loaded or operating Q in half.

> It sounds like I need to hit the charts for pi-networks, and pick the Q,

You need to measure it in place with the lid on. The chassis and lid in the Dentron, since they are right across the coil axis, greatly reduce inductance.

Whatever you measure outside the amp, you will have a lot less with the coil inside and the cover on.

> I have 2 large 400pf 2500v silver micas, and a strange 4 section variable

You will find some people complain about current rating, but in truth current rating is the least of your worries. The real problem with the caps is temperature coefficient and the fact Dentron's have terrible tank Q. The operating Q is far too high on many bands.

I suggest you get all the components correct, and get a tank operating Q between 10 and 15 on bands where you can. Ten meters will be higher than that because of stray C, so just use the lowest possible value there.

Then you can get NP0 (N P zero) caps of smaller value and parallel them for loading. Ameritron uses some ceramic chips that are high current temperature stable NP0, or you could use multiple N750 or less ceramic caps in parallel. You will not find high value doorknobs in stable temperature coefficients.

For the anode padding caps, you will probably need to use small value HV ceramics in parallel. You'll see Dentron, in MOST amps, has far too much capacitance and too little inductance.

Remember to measure that tank coil with the metal in place at the coil axis. You also must measure the coil at radio frequencies. One cheap common tool is a grid dip meter with a few fixed caps of known value... although a small light bulb, some fixed capacitors, and a transceiver will work every bit as well.

If you sustitute the word AVARAGE in place of RMS this will be
correct. There is no such thing as RMS power. :>)

Source record: 12271

There used to be a guy who sold paint for Hammarlund and (I think) some Hallicrafters radios, but I believe he disappeared from the Internet a few years ago.

If you take your cabinet to an auto paint supplier (not an auto parts store), they should be able to do a computer color match and mix up paint to match. If you have a sprayer, they'll give it to you in a quart can. If not, they can make up spray can(s) for you. I believe it cost twenty-some bucks the last time I did this, and one spray can was more than enough to do a cabinet.

In practice, there may not be a single "correct" color for a given model. There could have been different paint runs that were not strictly identical. The Hallicrafters SX-28 front panel is an example. Some of them are "reely reely dark grey," others look pure black. When I took in one SX-28 panel for a color match, they did a test drip on the back of the panel to doublecheck the color and wrote "midnight black" next to it. Duh. I could have saved a few bucks by picking up a can of black Rustoleum at the hardware store.

In any case, if you computer-match what's on your cabinet, then you have matched the color they were using in the factory on that day :-)

The poor man's solution is to take your cabinet to the local auto parts store and pick out a spray can with the closest color (assuming there's a reasonable match). If it looks right to you, it'll probably look right to everyone else.

But what is the condition of the radio now? Perhaps in its "original" condition, it is worthless, too. And perhaps worthless to you, but to the restorer, maybe it becomes a thing of beauty and joy. Not everything is tied to money. Remember that and you may get more enjoyment out of the hobby!!!. That's my 2 cents worth.

...for fixing up your old Heathkit HW-16. Pics, details, and order at
www.hayseedhamfest.com .

Easy to install - If you can put on a postage stamp, you can install one
of these.
Pre-cut holes and voids.
Self-Adhesive doesn't "stick" until you're ready for it to!
Durable - 6.4 mil thick.
Colorfast - Uses outdoor-durable solvent-based inks.
Abrasion Resistant - Thin, clear, laminated layer "seals in" inks.
Easy to follow instructions.

Tnx for looking and 73,
Tom N&#65533;JMY . .
www.hayseedhamfest.com

I do all my needed radios with matched paint. Sometimes its not cheap. For instance, Hallicrafters SX-71 front panel and lower cabinet paint is $47.00 for a pint.

By RMS power, I mean the power derived from RMS voltage or current as opposed to using the PEAK value of voltage and/or current to determine power. I suppose I could have said effective or heating power, or power derived from RMS values of voltage or current.

It gets too confusing when we say average power is the average of the average power.

By the way, there is no such thing as avarage power. :-)

> A repainted BA is WORTHLESS ! ! !

Many cabinets (and their contents) can be saved from the dumpster by a repaint.

Check out this Halli T-54 TV (companion to the SX-42 receiver).

http://cgi.ebay.com/HALLICRAFTERS-ANTIQUE-TV-1947-MODEL-T54-VINTAGE-7-INCH_W0QQitemZ6283486543QQcategoryZ3638QQrdZ1QQcmdZViewItem

Do you think that stripping & repainting the cabinet will make the entire set worthless?

Tell that to someone with a hopelessly dented/twisted T-54 cabinet, or someone with the electronically identical Halli 505 TV whose wooden cabinet was smashed into pieces.

Anybody with average skills could start with this hopeless-looking cabinet and make it look presentable in a day's work. Restoring the lettering would take a little more time, but I think you get my point.

If you're hooked on the aged look, I can sell you a few bales of used #0000 steel wool, stinky/soiled refinishing cloths, and other materials that you can rub onto your newly painted cabinet to make it look as "original" as you like.

Source record: 12291

Update,

My Dentron MLA-2500 has taken a back seat to my sons HS graduation, and the 20th anniversary to my XYL. That said, I did sneak in a little time for a few things:

1.) On 160 meters the 1000pf fixed loading capacitor is placed in parallel with the 80 meter 1000 pf fixed loading capacitor. These are then in parallel with the variable 500 pf (max) load control. Not much tuning range here. The Dentron schematics are clearly wrong by not showing this. Sure could use a bigger loading variable, and less fixed C for more tuning range.

2.) When replacing the RF PA plate load impedance with a carbon comp resistor between 1500-2500 ohms and hooking my RF impedance bridge (Autek) to the linear's 50 ohm output, I get a SWR null on all bands 160-10 meters by tuning the pi-net for each band. This makes me want to reverse engineer that pi net to figure out whatever the loaded Q may be, and to start optimizing for my use with a 8877. I still agree with Tony that those ceramic loading capacitors may be the crux of the problem because they are not made of the right stuff for carrying hi RF currents; instead these are made for bypass applications.

3.) The Alpha folks are trying to build a chimney for me with their Silastic RTV material. I think they are either going to charge me an arm and a leg, or kick the order back. This will be a custom design, and not an off the shelf part. I may go back to the solid Teflon block idea, and try to find a place that will machine it.

With SSB, or AM, doesn't a wattmeter show the average (over several sylables) reading of the RMS power? :-)

Ahhhh... That is just a pice of Silastic (TM) sheet wide enough and
long enough to form a chimney when wrapped around the tube. I can't
imagine it'd take much engineering. It's a very crude, but effective
design and easy to make if you have the material.

Some do and some don't. There are a number of watt meters including
at least one Bird model that are capable of measuring PEP. Even the
MFJ tuners have that capabililty but I don't know how accurage they'd
be.

Roger,

I proposed a single rectangular piece to wrap like they do on their 8874 amps. I even gave them dimensions, and a good picture of my 8874 mounted in the amp. A round continuous piece would also work. So far two business days have elapsed without a reply from Alpha. I hope to hear from them on Tuesday. I'll keep you posted.

For my brief tests I used a 10" long X 2" wide X .02" strip of Mylar wrapped around the tube. It worked fairly well, but got de-formed from the heat. I later jumpered the fan resistor to speed up the cooling fan. For some reason the MLA-2500 fan speed relay was not kicking in the high speed mode when keying the amp. I need to look further into that wiring, and see what is going on there. There is a button to enable the high speed fan option, but it does nothing until the thermal Klixon OT-switch clicks on, and then the fan goes to hi speed.

Jim

I did look an nothing came even close. I was doing a COMPLETE restoration on this radio and wanted to do it as right as possible. Now all I have to do is the white lettering using an ALPS printer and white lettering.

Only item left is the Johnson 6n2, which by the way comes with a spare final (5894) tube.

Hi Jim,
I've seen/heard most of the comments so far before. Here's my
solution, well tested by me and others. I have repainted several SX-101,
SX-115, and HT-32 cabinets, most needed it. They definitely looked much
better when done, and several other boatanchor guys have seen them and
agree they are a very good match to whatever was new. New varied by month
and year, so what it was 40-50 yrs ago is anyone's guess.
For the cabinet, I use Rustoleum V7777 Satin Black. It's great for
these units, and Drake 4-line cabinets.
For the perforated lid, I use Duplicolor Truck and Van Paint #T 229
Silver M. I think there may be a later no. now used for the same stuff,
and there is another mfgr with one almost as good, would have to search
for both no.s.
There are techniques for helping the finish come out best, drop me a
note & I'll dig up some info I've had luck with.

I'm trying to remember how the fan was set up in the 2500. I think
you are going to need to pressurize the chassis to get enough air flow
through the fins of the 8874s and they do take more air with a higher
pressure drop than the originals. Those little suckers are expensive
too.

Hi

electronicsurplus.com has 6' cheater cords, P/N 5-097
for $1.50. They should work fine with the SB-303.
I know they fit the HRO-500 and the Dow-Key electronic TR switch.

They have a good assortment of tube sockets and other surplus gear
to round out the minimum order.

2264. TS 520 and VFO 520 For Sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-01 03:57:09 UTC
From: ka6uup <ka6uup@pacbell.net>
Message-ID: <pAtfg.115743$F_3.24004@newssvr29.news.prodigy.net>
Source record: 12164

Guys,
I have a really nice TS 520 with VFO 520 for sale.
I have had it since 1981 and am the second owner.
This was my main rig until I bought a TENTEC Paragon and a Yeasu FT 897.
Now it just sits.
It includes all cables, users manuals, and the service manual for the TS
520.
It has a INRAD 400 HZ cw filter, and virtually new finals. (less than
half an hour on them).
The only problems is a broken fastener on the cover over the vox/hv knobs
on the left side and a small dimple on the edge of the tuning knob
insert on the VFO-520.
The paint shows some wear on the right side top and a few scratches.
I have pictures for anyone who wants them.
Working Condx is 10/10. Cosmetically 8-9/10.
It will be packed in original boxes and double boxed.
I am asking $300.00 plus shipping from 95203 (Stockton, Ca)
73,
Chuck

2265. Hallicrafyters SR-500 Tornado For Sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-01 05:38:14 UTC
From: ka6uup <ka6uup@pacbell.net>
Message-ID: <a3vfg.105622$dW3.74047@newssvr21.news.prodigy.com>
Source record: 12165

Guys,
I have a Hallicrafters SR-500 Tornado tribander for sale.
It covers 80, 40, and 20 Meters.
I am the second owner, and other than repainting the cabinets and
replacing the finals, (when I tried to remove the plate connectors,
one of the tubes cracked) :-(, it has needed nothing.
The front panels are near perfect. I have pictures which
I will send to anyone who wants them.
The rig is easily a 9 out of 10
I was lucky enough to find some Tungsol 8236s,
which were surplussed from a high-power lab.
These tubes are "Unobtainium" and very expensive when you can find them.
They are graphite plate and I see 220 Watts continuous out on my watt meter.
When I was using the rig frequently, It was pretty stable after warm-up,
but it has been on the self for 2-3 years and when I got it down
and hooked it up I discovered it had become "drifty" Not a lot but
enough to be irritating.
It may be it needs the tube pins and switches cleaned or a new Osc.or VR
tube.
I will leave that for the new owner.
I am asking $750.00, which includes an extra pair of NOS 8236s, Plus
shipping from Stockton, Ca. 95203
73,
Chuck

I appreciate the lead, but the M-301 cushions they sell are not genuine "NAF" cushions and do not have the molded slits necessary to install the elements. One has to cut with an exacto knife in order to use them, unfortunately.

Hi all.
A friend was tidying out his house and gave me a few radio related items to sell for him.
Among them were the items pictured on the following site - take a look-
http://www.qsl.net/gm7pok/

There's a wheatstone bridge. Lovely piece of gear (excuse the dust, it shows up bad in the photo). Made by Pye, and its owner thinks its circa WW2.
A galvanometer made by Shimadzu Seisakusho Ltd, Japan (try saying that when you're drunk). Its dated 1959 and has no doubt been used with the wheatstone bridge.
Also what appears to a be a multi meter, also made by the lengthily named Japanese company above. Maybe about the same vintage.

Its all in reasonable condition, despite the scratches which show up under flash photography. But I don't know if they work.

Anybody tell me anything about these things? Especially what they may be worth.

Thanks

Hi Jack

I did manage to find your web site but QSL.NET is so SLOW to access I
will need time to fully view the pix. But I should be able to offer
some info in due course if you email me.

I was unable to trace your normal email as I havent used QRZ for years
so my login has expired and its hard to re-instate.

Simon

That certainly looks like it. I looked at several Hammarlund pics last
night but didn't come across an HQ-120.

Thanks,

Barry - N4BUQ

From: Lou deGonzague <zenith@nycap.rr.com>
Message-ID: <iTegg.22797$8G3.5833@twister.nyroc.rr.com>
Source record: 12183

Thanks to everyone who helped with the info.. I do not have the cabinet
where the chart is placed. This radio had a burned out 15w 5K resistor
and the 200 ohm pot for the meter was totally shot(carbon flaked off).
Radio now works on the first 2 bands but dead on the upper. Unit was
recapped by the owner so not sure if there are any errors. It also had a
6BH6 where the 6BE6 should be.

Lou deGonzague wrote:

Source record: 12185

I have a very clean Kenwood TR-9130 2 meter All Mode Transceiver with the Communications Specialists SS-32P Tone Board Installed. This little rig works great. It puts out 25 watts or 5 watts.
The readout is clear and bright green. It comes with the mobile mount, power cable, mic, and original manual and instructions for the Tone Board. This transceiver has very low hours of use. It shows almost no wear. Cabinet and Front Panel are near perfect. Price is $200 plus shipping.
Thanks, Charlie Hugg

SolderSmoke #24: ROCKBOUND HB SSB, Two tone mp3, W1FB amp, SlimGem amp, ELSIE, Book review, Mailbag

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/231317

Topics discussed in SolderSmoke #24:

-- Mike's rockbound SSB success!
-- Two tone tests via mp3
-- W1FB 40 db amp strip
-- HF Packer SlimGem 5W MOSFET amps
-- ELSIE filter software
-- BOOK REVIEW: "From Crystal Sets to Sideband"
-- HF+6 diplexer
-- MAILBAG: Jerry AA6KI sends in "Lamp Talk" cartoon; Mike WA6ARA on VO-52 as a good QRP satellite.

NEXT EDITION: Bill will be using an Astatic D-104.

Listen at: http://www.ourmedia.org/node/231317

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

NEW RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software. We've been having trouble with our Ourmedia RSS feed, so Mike (software wizard that he is) has homebrewed his own RSS feed. In order to subscribe to SolderSmoke, point your podcast software to:

http://kl7r.ham-radio.ch/soldersmoke.rss

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/231317

Here's the homepage for our show. All our programs are available here. There is also a blog and links to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

73 from London

Source record: 12192

FS: SB401. condition 5 out of 10. Operates???? Don't care to know.

I bought it off of someone and got taken to the cleaners. They told me it was in very good shape and operable but that's not the case.

Quick description: This transmitter has a few minor mods to it. The cabinet is a 7 out of 10. Front panel is a 9 but grungy. It's moderately dirty inside. All electronic components seem to be in place including the tubes and tube shields. The VFO mechanics are messed up but the LMO seems like it's in very good shape as it rotates smoothly. VFO knob is missing. The cover for the PA is missing. No feet.

When I pulled it out of the box and saw the condition and I put it back in the box. It's been sitting in a corner for over a year. After the sale and several exchanges with the seller which turned out to be futile that's where it's been. I've decided to clean stuff out of the shack and this is the first to go. I'm offering this as a parts rig. I'm willing to part it out. But preferably I'd like to unload the whole thing at once and try to recoup at least part of what I got taken on. Pictures available on request. As far as I'm concerned this is a piece of junk however, it is restorable or can be used as a source for spare parts or restoration of another SB-401. I took a $100 hit on this. I'd like to recover at least $60 or $70 plus shipping for it. I'll ship to US only.

Email: rwalter@engineer.

> How often does one see a National NC-155?
> Decent receiver for a boatanchor?
> Photos at:
> http://home.mindspring.com/~arc5@ix.netcom.com/NC155/

Dave its pretty common on eBay -

Very nice looking but a poor SSB receiver - AM sounds good but S Meter does not work on this mode - just on SSB - Can't turn off AGC on CW - All this is on the fuction switch and you could re-wired it to make it more "user friendly".

Product detector is produced by using a crude LC circuits - not more expensive (stable) crystal based circuits - Envelope dectector is a simple IN34a diode.

National only made this baby for just two years (1961-63) which shows you just how well they were selling.

Overall I'd say it was about in the same class as a HEATH HR-10B -

I got mine off eBay and sold it on eBay a month later - Nothing wrong with it - it's just not that good. On the other hand I bought a NC-190 off the bay 3 years ago and I still have it. It's a MUCH better receiver plus it does SWL as well.

Best receiver of this time period is still the Drake 2B -

Biz WDï¿½HCO

Message-ID: <71891$4482eba8$d06640f9$8963@FUSE.NET>
Source record: 12197

The only issue with APRSPoint is that support and upgrades are sorely lacking. The Yahoo group he runs is censored so that any suggestions or criticisms of his product are not posted. He needs to really upgrade this program. It is one of the most expensive and also has the least amount of features. Nice start, but the author needs to really spend some time getting this program up to where all the other APRS programs are in functionality.

hxc98@yahoo.com wrote:

I'm looking for a very special knob.
They were used on Leutz superhets.
They are made up from a General Radio
main knob and a 4" metal dial skirt installed
by E.I.S. Experimenters Information Service.

I need ONE to complete my Leutz C-7 Special.
I will gladly pay $50 for one in nice condition.

Here's a URL to a web page with close-up
photos of the knob.
http://radioheaven.homestead.com/grknob.html

PLEASE, look through your junque boxes
and see if you have one of these.

2301. Wilcox Communications Receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-04 20:27:43 UTC
From: Adam Stouffer <adam_stouffer@hotmail.com>
Message-ID: <3nHgg.7943$3i3.5259@trnddc08>
Source record: 12201

Does anyone know what type of receiver this is? The front panel says Communications Receiver Type F3 by the Wilcox Electric Co. It looks to be early 50s by the tube compliment.

1940's design. Single channel jobs used primarily for HF avaiation comm at
airports.

I had one a few years ago crystalled up for WWV on 10 Mhz.

2305. FS TenTec Orion

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-04 23:46:41 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <BhKgg.35982$4H.3091@dukeread03>
Source record: 12205

I have for sale a TenTec Orion with the Automatic Antenna Tuner that is in Excellent Condition. I am the second owner and neither of us have used it much. It looks and operates like new. It did have a problem right after I purchased it and I sent it back to TenTec in February 2006. They went through it completely and fixed the problem and while it was there they did all the current mods to each board. I have all the documention from TenTec. It is completely up to date, except they installed the Firmware, Version 1.372.
That was current Firmware at the time, but they have since come out with a Version 2 of the Firmware.
This transceiver is loaded with all available filters. It comes with the original manual, shipping cartons, power cord, etc. I don't think you will find a nicer one on the used market. It is the best transceiver that I have ever owned, but I just don't operate it enough to justify the expense. Price is $2675 including the $330 worth of optional filters. I also have just about all the other optional accessories for the Orion and I will offer the Orion buyer first chance at these,e.g., TenTec mic, remote encoder/keypad, cooling fan that I never installed, matching power supply. Thanks, Charlie Hugg, K5MBX

2308. SBE-33 Repairs -

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-05 01:39:31 UTC
From: WD=?ISO-8859-1?B?2A==?=HCO - Biz <wd0hco@ev1.net>
Message-ID: <C0A8F583.1178%wd0hco@ev1.net>
Source record: 12208

Howdy - WDï¿½HCO Biz here ...

I am working on a moldie oldie - an old SBE-33 - one of the first transistor/hybrid tube rigs of the mid-60's. This rig was new when "I Dream of Jeannie" was broadcasted on NBC - 42 years ago I think.

Well anyway that's what I remembered - the rig is fixed and working great - but every now and then the "PA Load" cap shorts to ground and output goes bye-bye.

Old Faust Gonset used a trimmer cap for the PA LOAD. It's an ARCO L305 compression trimmer type - no value on the schematic but I am assuming its 180 mfd by the size.

Question is... has anyone worked on this and I am thinkin of pulling the whole thing out and putting a "REAL" variable cap in it's place.

Opinions Please... thanks - B

2309. Re: Wilcox Communications Receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-05 02:10:42 UTC
From: Peter Hayes <haystk@localnet.com>
Message-ID: <12874ku616l8587@corp.supernews.com>
Source record: 12209

Yes...that is a CW-3 Wilcox.
Many had a BFO and used by the Coast Guard for Fixed Frequency monitoring.
I have one of these fixed on 5696 MHZ.
Caps need replacement but slight Hum is not objectionable (yet)

k2aep

2310. Another SBE-33 Q

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-05 02:38:00 UTC
From: WD=?ISO-8859-1?B?2A==?=HCO - Biz <wd0hco@ev1.net>
Message-ID: <C0A90338.1181%wd0hco@ev1.net>
Source record: 12210

This might be of interest to others with similar old rigs -

The SBE-33 uses a 12DQ7 ($4.50) Driver and a pair of 27GB5's ($5.10 + $5.10) in a push push configuration. HV is about 460 vdc on the plates.

The question is like most - 95% of my time is spent listening. Seems like a waste of energy to lite up those tubes.

So I was thinking about putting a switch in back to turn filament voltage ON/OFF. Wondering if leaving the HVDC ON will strip off the electron space charge even if I am not transmitting but still using BIAS voltage. ON some old hybrid Kenwoods and Yaesu's they had filament and high volt switches in the front panel.

Another problem is the VFO would drift up due to the heat of the tubes so if everything was cold the dial would be off 5 to 8 kc. This is a tiny rig 0 the VFO is 8" from the Final Section - it's pretty stable after 20 mins.

Thinkin about the cost of tubes ($14.70) it might not be worth moding it - still what other problems might pop up?

I still might prototype ot anyway to see what happens...

2311. FS: Estate Ham Gear SK

FS Collins KWM-2A Transceiver
Needs work. Plugged it in and lights up and no receive or transmitt.
I looked inside, and see no crystals in it. It's a fixer upper or
parts radio. Cabinet needs repainting,etc.
All parts are in it. Don't see anything missing, other than crystals.
Make offer or let me know what you have to swap for it.
Remember AS IS, Don't work.

Two or three ideas.
The L305 has a capacitance range from 190 to 760pF (source
http://www.arco-electronics.com/productline_details.cfm?view_productlineID=12&productline_
categoryID=1
) if you are considering a replacement. Not an entirely bad idea.
Those Arco's are not hard to repair if you can get it out in your hands
to work on it. Most shorts come from mica dielectric sheets between the
plates that have cracked, shifted, or were too thin for your RF voltages to
begin with. Old Arco's from the junk box (or your favorite Ham's junk box)
are a source for new mica sheets if you find one or two that need
replacement.
I like stuff relatively unmodified, but hey, whatever you choose!

2330. FS: ITT Mackay Receiver Model 3022

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-06 22:34:27 UTC
From: moe@msn.com
Message-ID: <1149633267.798288.250230@g10g2000cwb.googlegroups.com>
Source record: 12230

This is a commercial quality receiver made by R.L. Drake for Mackay. It will cover 150 khz to 30 mhz in 23 frequency ranges. Like most Drake receivers the available tuning ranges are controlled by crystals in 500 khz segments. It is currently populated for most marine bands as well as the 75 meter ham band. The receiver will operate AM/USB/LSB/CW. The power cord, not supplied, will allow the unit to run off of 110vac, 220vac, or 12vdc. contact John k7rld@comcast.net or look at http://home.comcast.net/~k7rld/mackaya.htm . Price is $500. Buyer pays shipping.

Don't know about the crime but I do know about SB-303's.

That common cheater cord won't work.

The 303 used a "rare" line cord. Three wire, round pins. No longer
available but you can make a workable substitute.

Go to Radio Shack and buy their $4.99 "Mickey Mouse" line cord.
It's used on Dell laptops and some others. Take a hack saw and
carefully cut Mickey's ears free. Cut. Check the fit. Cut a
little more.

At some point, you'll be able to JAM the cord onto the SB-303. I
think the electrical pattern is the same but you should check that
yourself. ESPECIALLY since Heaths were home wired!!!

I've thought about doing a production run of "real" line cords
as there are some 50,000 -100,000 receivers made that use this
weirdo. Many cords have been lost, all are getting tired.

2343. Hallicrafter S-40B IF Transformer Silver Mica Capacitor Values ???

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-09 16:39:37 UTC
From: "Steven P. Burrows" <spburrows@cox.net>
Message-ID: <Dvhig.52727$9c6.47085@dukeread11>
Source record: 12243

I have been working on a pair of S-40B receivers over the last 18 months, and only recently became aware of the possibility of capacitor failure in the IF transformer cans. Based on my reading on the subject, I suspect that I may have one IF shorting out across its silver-mica cap.

I found a web page with a procedure for replacing these cap's, but I have no idea what the values are. There are two IF transformer part numbers in the S-40B, so I suspect that they have different caps.

The Hallicrafter part numbers are 50C243 (1st and 2nd IF) and 50C242 (detector).

I would greatly appreciate some help with this question.

I did align the IF's and they peaked up quite nicely. During the course
of aligning the 4 bands of the radio, I encountered problems with
setting 10 MHz on band 3. I was only able to get the signal down to
about 10.3 MHz before the oscillator ferrite slug was totally backed out
of the transformer.

I restored two S-40B's: one for my father and one for myself. On my
father's radio, band 3 aligned very nicely, as did the IF transformers.
On both radio's, band 4 was hopeless, so far as the low end of the dial
was concerned. The 18 MHz signal landed at about 19 MHz on the dial. I
checked which signal was the image frequency by tuning in the S-40B
oscillator signal on my digital Sony SW-77, so I don't think I was
aligning to images.

At some point last week I had to declare that both radios were as good
as I could make them, and put the cabinets back on. Sensitivity on both
radios was very good, and I could live with some dial inaccuracy.

Last night, while I was listening to my S-40B, it died on me (a fuse
that I installed in it blew) coincidentally at the same time that the
central air conditioner turned on. I suspected a power surge from the
AC switching on, so I replaced the radio fuse and it promptly blew
another. Based on an earlier experience with a "gasy" rectifier tube

that was arcing, I tried switching to a different 5Y3GT tube and blew a third fuse.

I learned of the silver - mica migration problem late in the restoration of these radios. My own problem with a band refusing to align without moving the oscillator slug to an extreme position was cited as a symptom of the IF cap problem on a web site that I found last night. I am planning to try powering up the radio this afternoon with all of the tubes pulled except the rectifier, just to see if it still blows fuses.

Even if the IF's are OK, and my present problem is a flaky tube,I expect that someday I will have to deal with the IF cans anyhow. So I would still like to find out what the internal cap values are for future reference.

The local oscillator is supposed to be below the signal frequency on Band 4. All the S-40 series operate this way including the S-40B. The LO is on the high side on the other bands. Make sure you are aligning the LO on the proper side of the signal frequency.

Best Regards,

Ed

I heard about this earlier, when I first encountered problems with band
4 and I took this peculiarity into account when I did the alignments.

Some of those are the old flip top relay rack cases. If the front
panel is 19" wide by a multiple of 1.75" (1.75" 3.5" 5.25" 7" 8.75" etc)
high it is a flip top relay rack case. They are common on boatanchors
and test equipment to convert a rack mount item to portable, or desktop.

Just in case you haven't checked it.... Be sure the the bandspread cap rotor plates are fully out while doing the alignment.

I bought an S-40B on ebay a couple years ago. I'm almost inspired to go to work on it.

Good luck

Don

2353. Amateur Radio licensing change in Spain: please, read!

Newsgroup: rec.radio.amateur.boatanchors

Source record: 12103

Hello!

On 10th July 2006 (local time; 9th July 22:00Z) a regulation change
related with Amateur Radio will be effective in Spain. Among other
things, it means that the three former license types (EA, EB and EC)
will be merged into a unique type with exactly same privileges.

So, please, if you hear an 'uncommon' EB or EC callsign in any amateur
radio band don't hesitate to answer.

73 JOSE - EB5AGV / EC5AAU

PS: I hope to work you on the 'new' (for me) bands :-)!

I have a few empty steel equipment cases from tube-type power supply trainers (military surplus) Each measures 8" high x 19" wide x 15" deep (including the 3" handles). The sides and front are removable with screws. I can supply a blank aluminum panel for a top or bottom cover for an additional $2 each. Asking $12 each plus postage (20 lbs from 36330 zip). Email or call 334-347-5281 day/eve. You can see pictures at: http://atlanta.craigslist.org/ele/164696713.html

Source record: 12113

One of the most frequent questions I receive is concerning the deterioration of the white silicon or vinyl cords on the older Weller TCP series soldering irons.

Weller does sell part number TC217, which is a black replacement cord with 3 pin plug already installed.
This is a good solution for the irons that have the Lightweight Nylon handle with black heater insulator/plug-in (after 1977) and mate to the WTCPN and later stations.

However, this is an expensive solution for the earlier TCP irons that had a phenolic handle/finger heat shield, such as the WTCPK (military set with 4-pin Jones plug) or W-TCP and WTCPL stations.

For these units, you have to cut off the 3-pin plug (expensive part of the assembly) from the replacement cord to wire the Jones plug or directly wire to the TCP base unit.

The phenolic handle irons used a metal ground strap that also serves as the cord's clamp and strain relief.
Removal and replacement of the old cord from this metal ground strap is difficult (and can be dangerous without proper tools)

Some restorers have used silicon or fiberglass/silicon sleeving or silicon tubing to build a new cord by removing the old vinyl or broken silicon insulation.

Another option is to use a replacement silicon cord from Rapid electronics (UK), order code 85-0590
which sells for 3.88 British pounds - considerably cheaper. This cable is not appropriate for the lightweight nylon handle, since it is slightly larger in outside diameter and uses the next high wire gauge 20 AWG .. instead of the original 22 AWG used by Weller.

Rapid order code 85-0590 Silicone, heat-resistant cable for soldering irons.
a.. Especially recommended for use with mains powered irons.
b.. Ideal for educational applications.
c.. Survives contact with a heated soldering iron tip.
d.. Convert existing PVC cabled irons to safer silicone cable.
e.. Pre-stripped and tinned.
f.. Overall length 1.5 metres.
g.. Suitable for use with all irons using 3-cored flexible cable.

I was reading the local newspaper yesterday...The Miles City Star (Montana) and they have a column called Stardust, about what happened 25, 50 and 100 years ago here in Miles City. In the 100 years ago section there was a little tidbit that I found highly interesting. I'll quote it exactly as it was printed in the paper. Keep in mind that what was said here was printed 100 years ago...1906...in the Miles City Star:
"R. B. Sigafoos, northwestern manager of the American DeForest Wireless Telegraph Co., gave a talk at the court house Friday night on the system. Wireless telephones, yea, even pocket telephones no larger than a man's watch, are promised by Mr. Sigafoos as the system developes."
Like I said...this was 100 years ago. This guy had a firm grip on what was to come didn't he ??? Just thought I'd share this.
Ben

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/235576

Topics discussed in SolderSmoke #25:

-- Bill puts Astatic D-104 on ECHOLINK
-- Mike's 80 mtr DSB rig becomes transceiver!
-- Mike's two chip EMRFD NE602-LM386 receiver
-- The rewards of homebrewing

NEXT EDITION: RECORDINGS OF MIKE and BILL's DSB
RECEIVERS!

Listen at: http://www.ourmedia.org/node/235576

Background:
Tired of listening to Led Zepplin or NPR on your
I-Pod? Wouldn't you like to be able to carry with
you the kinds of ham radio conversations that you
listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in
London, England meet regularly on the ECHOLINK system
to discuss their homebrew radio projects. We are
making them available as PODCASTS.

NEW RSS FEED: You can subscribe to the program, have
them downloaded to your MP-3 player, and listen to
them at your convenience. To subscribe, just cut and
paste this URL into your I-poder (or similar)
software. We've been having trouble with our Ourmedia
RSS feed, so Mike (software wizard that he is) has
homebrewed his own RSS feed. In order to subscribe to
SolderSmoke, point your podcast software to:

http://kl7r.ham-radio.ch/soldersmoke.rss

If you don't have an MP3 player you can just go to the
site below and listen to the latest program (and
earlier editions) using the audio software on your
computer.

http://www.ourmedia.org/node/235576

Here's the homepage for our show. All our programs are available here. There is also a blog and links to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

73 from London

Lynn - YOUR THE MAN !!

I looked on Google for an hour and gave up and here your got the info right there - Well anyway I was lazy and tried to order the cap - you know the drill - gotta order through the distributors - called several - all say minumum order required - 4 weeks delivery -

So I took your suggestion and tried rebuilding it - didn't have the exact cap in the junkbox but had several that same physical size - the hardest part was getting that little bugger out of the rig!

Took it apart and your right - there where several places where RF had punch some holes in the Mica - pretty small but you could see it without a mag glass - Replaced the sheets and borrowed a friends digital cap meter to check out the range - re-installed and now it tunes correctly -

Interesting design - I wondered why they would use a padder cap for final tune - guess it was the only way to get 700 pikes in such a small space so you can tune a wide variety of ants - if you were going to use this with an amp you could get away with a small vairable with 360 pikes or less.

Overall the whole TX side was designed for low level duty cycle - typical SSB. If someone tried RTTY on this thing I have no doubts it would blow up in 10 minutes - The design was ahead of its time in the early 60's. No way this 42 year old radio can keep up with today's jap rigs - still it works well enough to use everyday on 40 and 80.

The filament situation still bothers me - in the 60's tubes were 90 cents each, gas was 35 cents a gallon and electricity was 2 cents a kwh. Ah the good ol days!

Today, its different and I want those tubes OFF when I spend time listening on the bands - but I'm like you Lynn, hate to drill holes and ruin a nice piece of equipment.

Then it came to me - if I could find a 10k pot with a switch, I could replace the Mic Gain pot and turn the Filaments ON/OFF with the Mic Gain control. Only need Mic Gain when the transmitter is ON anyway so it makes sense and I don't have to drill a hole for a toggle switch.

So that's the next project!

Thanks for all your help! - Biz WDï¿½HCO

I have the following items on ebay. Thanks for looking. If the links
do not work than just search for seller 84-rooms! or try this link.
http://search.ebay.com/_W0QQsassZ84Q2droomsQ21
I have others not listed in this email so check out my other auctions.

I am clearing out my garage so there will be lots of unique items.
Thanks,

Items ending June 14th

Allen Bradley 800T-A2A Series C Flush Head Black Button $15.99
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=7627428242

Allen Bradley 800T-A1A Series C Flush Head Green Button $15.99
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=7627443290

Allen Bradley 700-NT Pneumatic Time-Delay Attachment $24.99
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=7627465542

Allen Bradley 800T-B9M Serie B Flush Head Yellow Button $15.99

Kudos, Biz. Don't kill the good ones just for some special, private mod.
I had one of these and the T/R relay got erratic - ear-splitting noisy on
Rx. I probably could have fixed it with a little creative bending, but sold
it.

Ok guys and gals I aquired a bunch of stuff but going with the first one here the BC 344 low band reciever.. It got the AC plug and has all tubes I am told this was working. Everything seems to be there. Am i doing something wrong? I rigged up a ac cord plugged it in and nothing..

Next up ARR7 military variant of the sx28. It has mods.. I cant get it out of the box. but has a jones plug on the front and a old style i guess you would call it collins type connector coming out the side. Also a RCA jack on the side which i assume is for a sb -10 that i got with it. What do i need to power this puppy?

I am a virgin on all this military gear.. had some grc 109s along time ago but nothing like this.

Thanks

Well had nothing to do today so I thought I'd go ahead with the tube
filament mod.

First thing was to search the old junk box. Found a nice 5K POT with a
switch to replace the original 10K Mic Gain. As it turns out, 5K is all you
need for mic gain with the standard SBE hand mic. If you use the SBE power
mic you might have to use all 10k if you dont know how to turn down the
pre-amp inside the mic base.

To replace the pot you have to dismantle the whole front face plate. While I
was doing this I notice the speaker had a hole in the cone. I walked
backwards into the XYL's bathroom and got her "Sally Hansen Hard as Nails".
It's great for repairing speaker cones and for use as "arc dope". The only
drawback is when the XYL finds out and starts with the QRM. Usually ends

when she says her cosmetics closet is not a tool box. At this point she sends something flying usually in my direction and at this time I QRT to the ham shack.

Assembled the whole front panel and gave a few transmissions - works perfectly with the new pot - now to turn the filaments off.

Studied the schematic and looked around near the finals - right there on PIN #5 of V3 was a small un-insulated wire tied to a terminal board. Usually an un-inslated wire means a option of some sort so with the rig ON and the HV B+ flowing to the plates - I slowly brought my dikes to the uninsulated wire and snipped it. All of sudden all tubes when dark - AHHH... PERFECT !!! I then took 2 5" pieces of #26 gauge wire and twisted them together - hooked up one end to pin #5 of V3 and the other wire to the terminal board where the un-insualted wired was tied to. The other ends where then soldered to the switch. Now to turn ON the radio - oh shit it WAS ON ! I guess angels DO EXIST! well to make a short story long - I can now turn the filaments ON/OFF by using the mic gain control - few contacts later - none reported any 60 cycle hum over the mic audio - it's as clean as can be.

So now I can listen all day and just fire up the tubes when I need 'em.

Clearly Faust Gonset - thought hams would this mod for port/mobile to keep current demands low.

Next mods

(1) Amp Control - don't have the SBE SB-1LA amp. SBE 33 provides +10 VDC during XMIT and 0 VDC during RX. Mod would insert a 10V relay or Reed Relay to control my AMERITRON 811. Will put everything inside the rig.

(2) Replace #49 bulb with a superbright White LED - but can wait until the 49 burns out.

(3) Add superbright RED LED which only lites during during XMIT. Lots of CB sets do this - stupid but what the hell! I'll put my foot down on the rodger beep. HI HI

(4) last mod - replace RCA female ant connector with SO-239 so it matches all my other rigs and cables.

Also planning to paint the cabinet light blue and add some extender feet to the front.

After all - that is it still an SBE 33 ?

I don't know..... but at least its mine. :^)

- Biz WDï¿½HCO

2382. FS 1946 RCA 54B1 Battery Operated Portable

2383. BC-348-Q Repairs - Looking for advice

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-14 05:02:40 UTC
From: "H. P. Friedrichs" <noemail@please.com>
Message-ID: <7eidneQ0feztBRLZnZ2dneKdnZydnZ2d@velocitywest.com>
Source record: 12133
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

I recently acquired a BC-348 Q in fairly decent shape and have set about getting it into useable condition.

First, I found a dead tube (open filament). Since some of the others tested weak on my tester, I collected a full complement of NOS tubes and repopulated the set. No go.

Next, I found a wiring error made by somebody who had attempted the 28v to 6 volt filament conversion. The error left both sides of one of the tube's filaments hooked to A+, i.e. no way it could light up. This was easily corrected.

Once I fixed this, I could hear stations...albeit faintly. While poking around the 1st RF section, I found an open (literally cracked open) plate resistor. With that replaced, the radio generates enough volume to drive a small speaker to comfortable levels.

I cannot seem to get the BFO working, however. The resistors around the BFO seem to check out ok. The condition of the caps are unknown at this time, though I have not run across bad silver micas or the pF dogbones.

I know the larger uF caps are prone to dry out and deteriorate, but I tried shunting a few of them with alligator leads and known-good units. It didn't seem to make much difference.

What are my options? Is there a common failure mode for the BFO in this set? Short of removing parts and testing them out-of-circuit what are my options? Does anyone have a functional BC-348 Q who could give me nominal voltage readings around the pins of the VT-233 that I could compare with mine?

Side note: The crystal filter also appears not to work. Basically, it behaves like an open...nothing gets past it, unless bypassed by the switch. Do these particular crystals tend to deteriorate and die with age? What do you replace it with, a crystal ground to the IF freq?

I'd be interested in corresponding with somebody who has been successful in restoring one of these radios. My email address is

hpf atsign gainbroadband dotcom

Thanks,
Pete
AC7ZL

Congratulations on getting this far....The BC-348 is a good, classic military radio and quite a good listener when fully restored.

You need to examine every resistor in the set. Some of them can and will drift upward in value quite substantially as they age under the best conditions, and most of these radios were used under conditions that are far from the best. If any resistor measures more than about 10% off the marked value, I would replace it.

>
> I know the larger uF caps are prone to dry out and deteriorate, but I
> tried shunting a few of them with alligator leads and known-good units.
> It didn't seem to make much difference.

Shunting the caps is not a particularly effective troubleshooting technique because most of these caps are not open, but leaky. Shunting a good one across a leaky one will have minimal noticeable impact on performance unless one lead of the original cap is disconnected first.

Come to think of it, you might as well replace all the paper and electrolytic caps in this radio. Most of them are probably going to be bad anyway.

I don't have a BC-348 presently, but this site has manuals freely available for download that will tell you practically everything you need to know about this radio in almost nauseating detail:

http://www.jamminpower.com/main/bc348.jsp

The files there are huge, but these are the clearest BC-348 manual scans I have ever seen...Well worth the download.

> age? What do you replace it with, a crystal ground to the IF freq?

You will probably have to get one from a junker BC-348 chassis. IIRC,
the IF frequency of this radio is 910KC, which is somewhat unique.

"...somewhat unique."
....a little bit pregnant.
....almost alive.

GRRRRRR.......

Either it is, or it isn't.

....unusual.
....somewhat rare.
....not typical.
....specific to this unit.
....hard to find.

Otherwise, the advice is directly on point.

However, "almost" doesn't mean _a_bit_; indeed, if there were only two of something, then each could be _almost_ unique.

> Otherwise, the advice is directly on point.

Yep.

2387. Wanted: DM-28-R dynamotor for BC-348-R receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-14 12:08:51 UTC
From: k5dh@raytheon.com
Message-ID: <n%Sjg.1$FN2.0@dfw-service2.ext.ray.com>
Source record: 12137
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I am in need of a DM-28-R dynamotor for a BC-348-R receiver.
Must be in working condition. Not too concerned about looks
(can't see it anyway, once it's installed in the receiver!).
Once I finish restoring this receiver, it will be installed
aboard a B-17.

Thanks and 73,
Dean K5DH

I would like to help. I have a 348Q in quite good working shape, but I
would not be able to get into it to take measurments for about 10 days
due to family upheaval. You can download a manual from the BAMA site,
which should give voltage and resistance norms.

Actually a 910 khz IF makes a great deal of sense in a rig with an XTAL filter, low frequency coverage and no broadcast band. It gives a considerable improvement in image rejection on the higher bands. The XTAL takes care of the selectivity lost by the higher IF.

Hi,

The Heath SB-10 is not for use with a receiver.
It is a sideband adapter for the Heath Apache transmitter
or DX-100B transmitter.

An RCA jack on the ARR7 receiver may be for a Heath Q-multiplier,
which would add selectivity to the receiver, or can be used
to notch out a heterodyne. You will have to trace out
where that RCA connector ends up (once you manage
to get it out of the cabinet without hurting yourself!).

There's a Dzus fastener (1/4 turn) on the rear of the cabinet. That's all that holds the slide-on case other then the fact that if they get corroded, they are very hard to slide out of the case. Regarding the receiver being an SX-28... more like the SX-32... maybe. Can't figure why someone would rig a "Collins" connector out the side. I've seen the Cannon plug on the front panel replaced with an Octal plug but that's about all???? Curious.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 18yh 2006
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and

How did you determine that the BFO is not working? I'm thinking that
it might be working and just off frequency due to bad caps.

Roger,

I presumed it (the BFO) was not working because

a) There is no audible evidence of function, that is, it is not
producing beat notes against CW

b) I tried probing in that area with a scope and saw no evidence of
oscillation

c) I injected a sine wave from an external signal generator into that
circuit, and could then make out CW notes.

You might be right, it might be working but at the wrong frequency. On
the other hand, item (b) suggests it's not working at all.

Man, I wish I still had one. A BC 348...big and black...was given to me
by my Elmer 35 years ago in my novice years. He built a basic power
supply: rectifiers but no transformer...I got a nasty shock if I didn't
plug it in right (in the old days before polarized plugs) It did manage
to keep me awake during those wee hour ops. It was a neat receiver!

Ok guys got the cover off this thing is like brand new.. Anyhow the
plug collins type maybe i am stating that wrong its a 4 prong plug the
older style thats round that is used on lets say heathkits etc... It
is wired to the Motor switch on the rig.. two wires to the switch.

Ok so now what sort of power do i need to get this thing going? I prob
can find a jones type plug but then again i could change that out to
todays standards also.. Is this 12V? I dont want to put power to it Id
hate to fry this thing..

Thanks

What are the plate and cathode voltages on the BFO tube? I am thinking you might have a bad resistor.

Ok.. the ARR-7 requires the following voltages:
270VDC .135A (B+)
24VDC .35A (motor and clutch)
6.3VAC 4.0A (fils)

This receiver ran off a 115VAC 400Hz aircraft supply, rather than a dynamotor.

Ok I have a Lambda 32M 300 volt variable supply I am betting my bottom dollar that it was used for this reciever. And the small power supply that I have was made for the motor and clutch. I will look into this a bit more. Thanks for the info.

Also just came across a ARB reciever that has some mods trying to figure that out too. But think we need to take one project at a time and thats the ARR-7. It is really in mint shape inside I am amazed.

thanks
John

Check this BS out! Amazing that this jerk continues to sell on Ebay with his obvious lies and misrepresentation. This is nothing more than a poor homebrew fake. I know who made it and he made a few more out of surplus items. RADIOMART's stories are totally made up. He has no personal collections, he swindles SK widows and runs another ebay name to buy on the cheap and then makes up stories about the same equipment to lend credibility. This guy is a snake. BEWARE!!!!!

RM has over 4,000 positive feedbacks.

He is the self-proclaimed Market Leader in Drake and Collins.

That means over 4,000 people so want to beleive in this guy and his products that they will (stupidly) fall over themselves and others to buy his crap.

We are the real morons here, buying into his line of BS.....RM is just filling a need in the amateur community: the need to outdo the other guy, possess that precious Collins or Drake trophy...even if it is a fake.

Some day when inflation runs rampant and we need to spend our disposable income on heating our homes rather than buying useless radio's, RM will come to an end.

Hi,
I have bought a few things from him in the past.
His descriptions such as;
Like the day it was made;
Mint condition;
Better than new;
A true chance to own a museum quality radio;
The best one I have ever seen;
I have never seen one in this condition.
My radios that I bought from him that had these types of descriptions
were
not as nice as the above wording. Although they arrived in one piece
the
packing on 2 radios was not the greatest and evry time I did buy
something from him
I always asked for the best packing and I would pay extra for it.
(NOT!)
The radios were not in the mint condition 10 out of 10 and perfect.
I have had scratches, dents and dings, some contols not working etc..
So if I now see something he has that I may like, I am very leary of
buying it
and look at others for sale on ebay at better prices and condition,
Just adding my 10 cents worth (inflation and price of gas)
Rich

I did your same job you some time ago, when I restored a non working BC-348.

It is very difficult to give you advices by e-mail. The obvious way to proceed is to start from the audio power stage and go up in the chain, checking the wiring and voltages. I found that the wiring had been modified in several places.

Also in my case I had the impression that the crystal filter was not working. Initally I had simply tuned the IF transformers for maximum output. But I then realized that the IF transformers were tuned on a frequency quite far from the crystal resonant frequency (910 KHz). After retuning the IF chain on precisely 910 KHz with the aid of a signal generator the crystal filter started to work normally.

Hey - I can make no comments about this person, my only note is his language is like a real estate salesman hi hi. If its homebrew, I would like to do as well - its nice. And he doesnt say its made by Collins - the phrase is "Collins like" - ok, a fine detail, but accurate for fine print legal purposes......

And really people - if you want a museum piece as an investment, then search for one and be prepared to pay an outrageous price for some old ham gear. Just dont turn it on or use it on air - you might lessen its "value" - If you want what "looks" like a nice ATU that would not be out of place in a Collins setup, then bid what you think its worth - its your choice....

And I am not looking to start a flame war, Collins gear is VERY nice and worth collecting and using. But Art Collins was NOT God, and having a shack full of immaculate 60's consumer electronics, however well engineered, will NOT get you into heaven.

Of course Martyn from RadioMart is a liar and a cheat.

He bought a barely working Drake R4C from a friend of mine and put it
on ebay as "one of the best he ever had from his personal collection".

Stuff like that isn't called salesmanship or creative marketing. It's
called fraud.

There is a reason that he, and other ebay'ers do that. Most states exempt sales of "personal affects" from the requirement of a trader's license, and the collection of sales/use tax... So, the ebay'ers claim that the items are from their personal collection in hopes of fooling the tax man.

Whenever you see that little phrase, and a high feedback number, you can be sure that a tax cheat scam is going on. If you feel compelled to put a wrench in the works, a quick call to the sales and use tax division for the appropriate state will often do the trick.

2428. first time amplifier use

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-18 20:53:31 UTC
From: Craig <caheaton@netzero.net>
Message-ID: <57614$4495bd41$4831d174$995@FUSE.NET>
Source record: 12078

Hello,
Yesterday at a local Hamfest I purchased my first HF amplifier (a Heathkit SB-230). I understand that the tubes for these amps is very hard to find and very expensive when you do find one (hmmm....perhaps one day sell this off for parts...the tube alone equals most of what I payed for the amp). Anyway, given these facts I am planning on babying this amp during the tuning process. I have used a club amp many years ago, so am familiar with tuning by dipping the plate, adjust load for output, repeat, etc. I am also planning on purchasing Ameritron's inrush current protector to limit wear on the amp. The final piece of hardware is a tuning pulser...Amertron has one...the ATP-102...seems a bit pricey given what it does. I already have an electronic keyer....could the same results be had by sending a string of dits at around 50 or 60WPM or is the pulser a better way to go. Also, any other tips on tuning and operating this amp? (I've read about the limited parasitic protection and am debating adding a kit to improve that or maybe just putting on new ferrite beads, but am going to take my chances for now before going that route. I need to test this amp out soon before I seller "forgets" my purchase (he gave me his call and contact number and promised a refund if I had any problems with the amp).

Thanks a bunch!
Craig KB8FGC

Hi, Craig

If you do a Google search for Heath SB-230, you will see
a thread in the "AMPS" email reflector.

Here is a synopsis of the thread:

Tom Rauch W8JI reported that he once studied the SB-230
as a contract engr for Heath.

He said that the grid can be easily damaged since there is no
grid protection circuit at all. Load the amp heavily
(pi network loading capacitor adjustment) to keep
the grid current down, as a percentage of plate current.

The grid dissipation rating of an 8873
is only about 5W, (60 mA grid current in the SB-230),
therefore can be easily damaged.

Carl KM1H said the max plate
disapation rating is only about 200W using the heat sink
without a fan. A fan should be added.

Tom also said that a series 25 Ohm 25W
resistor should be added to the B+ supply (to protect
the tube in case of an internal arc).
Carl said to use an enameled wirewound for this,
not a cement resistor.

Richard Measures said that the stock SB-230 has plate
resonances near 150 MHz and a higher freq resonance
which can cause "Big Bang" parasitics.

In answer to your question,
a c.w. keyer should work equivalently to a tuning pulser
if you can reduce the "on" time of the dot keying
well below 50%, and smoothly control the power output
of your exciter in c.w. mode. Monitor the peak rf output
with a scope. The duty cyle of the ATP-102
tuning pulser can be reduced to about 10 percent.

Completely rebuilt by the R-1051 shop less than one year ago. Complete with a set of U.S. Navy speakers with volume controls and audio cables with proper audio connectors. Mil-Spec power connector and cord. N coax adapter. This receiver was a complete rebuil;d, including the high failure frequency standard temperature components with new parts. Works perfectly, front panel is a 9+, top of case has the normal scratches, rear panel is dent free, (a rarity).

$300, pick-up only in Gulfport, Ms.

On Sun, 18 Jun 2006, Craig wrote:

> Hello,
> Yesterday at a local Hamfest I purchased my first HF amplifier (a
> Heathkit SB-230).

I had an SB-230 once and as a "half-gallon" DC input amp without any fan but with a small size, it worked well. Once I was off resonance and the thermal cut-out shut down the amp (would not activate the change over relay) until the heat sink cooled off (another issue you may want to be concerned in case it works or does not work).

Probably the issue that is more important than anything else is that the 8873 is conduction-cooled through a beryllium "thermal link" (one inch by one inch by 1/4 inch, roughly in size, and beryllium has the novel physical property that it is one of the few materials that conducts heat but does not conduct electricity) and that beryllium metal is chemically toxic to life. Recommendations for handling beryllium includes that you do not touch it with your fingers, and you do absolutely no machining on it including drilling, filing, cutting, etc. The dust particles are even more toxic. If you go back through old QSTs or old Heathkit catalogs and pay attention to when the SB-230 was discontinued, then look in the QSTs for that date era, you will find a small announcement about the fact the Heath decided to discontinue the SB-230 because of the toxicity of that thermal link (I remember reading it myself). You can also get more recent copies of "The Handbook of Physics and Chemistry" where you will also find a disclosure about the toxicity of beryllium (you might just google the element and see if this fact shows up).

I am sure that our enviroment includes all manner and well scattered pieces of toxic, dangerous solids, liquids, etc., just waiting for us to partake and get sick (read any history of Love Canal, etc., or any other serious chemical spills where people were hurt), but you might want to consider what you will do with that amplifier, someday, in the future. It does not lend itself very well to modification to some other tube (I thought about it myself). Long ago I sold my copy of the SB-230 to someone and I don't remember if it was before or after I learned about the toxicity of the thermal link, but I remember reading the very small notice in QST from Heath about the problem and that that was the reason for discontinuing the amp. There are water-cooled amplifier tube circuits that, IIRC, don't need these beryllium thermal links and you might want to look around at these for ideas.

Yes, all those 887X metal-glass/ceramic tubes went up greatly in price
over the years that they were being produced. Makes amps with 3-500Zs,
811s, 572-Bs look real good if you need to replace a tube or two or more.

Outside of that, I never had any problem with my SB-230 and I used it a
moderate amount when I had it.

I understand that the tubes for these amps is very hard

2442. Inrush Current Limiter for Hallicrafters S-40B?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-21 01:16:20 UTC
From: "Steven P. Burrows" <spburrows@cox.net>
Message-ID: <461mg.57866$9c6.34117@dukeread11>
Source record: 12092

I recently completed restoring a pair of S-40B radios. The original power transformers were pretty marginal, so I replaced them with similar transformers that I bought from Antique Electronic Supply (the new xfrmrs were Fender amp replacements). Everything seemed to work ok for a couple of weeks of light use of my radio (I gave the other to my father).

Last week while I was listening to my S-40B, its power supply blew a fuse (a 5A cartridge fuse that I installed in the radio). I traced the problem back to the "new" power transformer. It appeared to have a short circuit of some kind, though I could never pin down exactly where this short was using a DVM.

The initial fuse blow occurred while the radio was running and my house's central air conditioner was switching on. Up to that first fuse blow, I noticed some significant flicker in the dial lamps (run off the filament winding on the power transformer). At first I thought that I was watching a dying lamp bulb, but now it seems that I was witnessing the breakdown of the power transformer.

My question is, would installing an inrush current protector thermistor in the primary winding circuit of this radio prevent a repeat of the transformer breakdown? If this is a good move, what size of thermistor should I use? Any help or recommendations would be appreciated.

Steve Burrows

Steve,

When I was a Novice, I used a S-40B on 80-40-15 meters CW. Boy, 15 meters CW was a challenge with that primitive receiver! They did a good job with AM broadcast however, and the audio was decent.

Now the bad news. Maybe your rectifier tube showed a series of bright sparks leading to the blown fuse? If so, the B+ was being dragged down somewhere, and likely from a leaky, or shorted capacitor. It's quick and easy to pull the rectifier (5Y3??) and see if the fuse blows again. A 5 ampere fuse is pretty heavy for a S-40B, so in the future consider a 2 amp unit. If there was no short, or bad 5Y3, then your new transformer was likely marginal, and I bet would have failed regardless of what you did.

That said, if large transients come down the power line, you can filter these out to a point. One option is to add a varistor across the primary leads of the transformer. These are made by GE and others, and the part number will be similar to V130LA10A. This means the part is rated for 130 volts RMS AC, and 10 Joule rated. I believe Radio Shack has these.

I don't believe an inrush current limiter is a solution here. These are more useful when a big light dimming surge occurs when turning on a big Linear amplifier like the Dentron MLA-2500.

Good luck with that S-40B,
Jim

Hello, I have a little used MFJ-492 electronic keyer that I've decided to put to good use as an amplifier tuner. (This is my first amp). The keyer defaults to a 50% duty cycle and I would like to get this down to around 10 or 20 percent. Any suggestions on what weight to use? This keyer is adjustable from 5 to 95 percent weight...I do not have a scope so would have to guess by ear. Thanks for the help.

It seems to me highly unlikely that a new power transformer could develop
a short circuit (somewhere in its windings) and you should look for
the exact cause of the fuse blowing. Another response indicated that 5
amps is much higher than you should have, and something more like 2 amps
is better. Is the new transformer a good match to the old one? Does it get
very hot when it is running? Is the plate voltage about right coming out
of the S-40 power supply? When you "traced the problem back to the 'new'
power transformer" what was it that you traced and how?

You really should not need to go to this extreme. Think how many millions
of such radios and TV sets and HiFi/stereo sets were used in the last
50-60 years with very very little problems. Only some very rare freak
voltage spike might cause peak voltage on the electrolytic to go past
breakdown and with a vacuum tube rectifier and some capacitance in the
electrolytic, it would have to be a pretty freakish high pulse voltage for
a fairly long time interval to kill whatever sections in the electrolytic
cap would break down for a freak pulse.

Is the receiver still blowing fuses? Is it not working any more, period?

If this is a good move, what size of thermistor should I use?

2446. Re: Inrush Current Limiter for Hallicrafters S-40B?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-21 12:59:58 UTC
From: "Steven P. Burrows" <spburrows@cox.net>
Message-ID: <lpbmg.57892$9c6.52561@dukeread11>
Source record: 11996

The B+ voltage delivered by the new transformer is about 50 volts higher than Hallicrafters' original spec., which I was advised was not a big problem. The other secondaries for the tube filaments and rectifier filament were exactly right.

Throughout my use of this restored S-40B, I have been running it off of a personal computer grade surge suppressor power strip, along with my other old radios (others are solid state).

I replaced the power supply electrolytic caps with new ones, so I doubt that this was a problem. From past experience with arcing in the rectifier tube, I also looked into this possible cause. My rectifier tube was also OK.

I pulled all of the tubes from the radio and powered it up in a darkened room to attempt to see any potential arcing under the chassis. The fuse blew, and there was no visible evidence of any problems in the radio wiring.

Next I disconnected the secondaries of the power transformer from the radio entirely. The fuse still blew.

Next I removed the safety filter capacitors from the transformer primary circuits. Fuse still blew. I traced out the primary circuit with a DVM and found no short circuits in my wiring or from the transformer windings to each other or to the transformer frame. With the transformer completely taken out of the radio the fuse blowing stopped. I was forced to conclude that the "new" transformer was a dud.

I don't have access right now to a variac, but I suspect that there might be some sort of arcing in the transformer that doesn't show up until higher voltages are applied. I still have this transformer, and I might try looking at it again later this year when I can borrow a variac from the university where I work.

I have replaced the suspect transformer and so far the radio is working fine. My interest in using inrush current limiters is motivated by trying to avoid a repeat of a damaged transformer, both in my father's S-40B or my own.

In spite of having a fancy microprocessor based Sony SW-77 to do my SWLing on, I find using this old 'boatanchor' type radio irresistible. After I finish up grad school (which I am starting rather late in life - age 46) I plan to go for a ham license and possibly look into using other BA gear.

That is correct, it is not a big problem, it is a *HUGE* problem.

Most of these older radios were designed for a 115V nominal power line voltage. Today, people complain if the voltage is as low as 120V at the outlet. It is more typically 123 to 125V. That means that even using the original transformer, you will have nearly a 10% more B+ voltage than the designers envisioned. So, your +225 will be +240V. You are running 50 more than spec, so your +225 will be +275, which will kill the caps and shorten the lives of the tubes in your radio. (OBTW, the voltages I used in the above description are just guesses. I am not certain what the actual design voltage is for your radio.)

...

It was most likely damaged by the manufacturer. It is easy to nick a winding through careless handling. The problem usually occurs where the inside end of the primary (or secondary) crosses the windings to get to the outside where the leads are attached. You can often cut the bobbin away, and find the short.

Intermittent arcing is unlikely. Because of the relatively high currents, and low voltages involved, it will usually burn off a wire, or weld it permanently together.

>
> I have replaced the suspect transformer and so far the radio is working

Transformers are relatively immune to voltage spikes. For reasons of manufacturing economy, the core is usually run right on the edge of where it starts to become nonlinear (eg. saturation is beginning). If a spike comes down the line, the spike will drive the core into saturation, and that simple act will prevent the spike from being "transformed" to the secondary. A lightning strike is a different matter. It will usually cause an arc from the primary lead that is closest to the core to the core. The lead will often be vaporized.

The "not a problem" transformer had a B+ of 25 V lower. Last year you
wrote:

"I have looked over the offerings from Antique Electronics Supply, and their
Fender transformers are a close match. Unfortunately, the Fender
transformers offered there top out at 325-0-325 V for the secondary
windings. I need a transformer with 350-0-350 V / 70 mA, 5 VAC / 2A, and
6.3 VAC / 2.6A secondary windings. "

Be sure your power supply electrolytics can take the peak rectified B+. If
your new transformer is really putting out 375 V, the peak voltage is 525 V.

I'd be alot more comfortable if the B+ voltage was at the original spec or a
little below.

You can usually hear arcing. Smoke might also start coming out. It sounds
like you've got a dead short. There's a chance you might find it if you
take off the endbell and inspect the area carefully. Don't count on it.

The S-40s are decent beginner radios in that they do work and they aren't
too hard to work on. But there are better radios out there!

The beauty of the old tube rigs is that they are pretty much immune to the junk coming in the power line. In fact, they carried us through WWII with poorly regulated power supplies, bullets and bombs. I believe the power transformer burning out is due to either a defect in the transformer or excessive load upon it. Leaky paper caps in the receiver can provide a substantial load increase, and that may have been worsened by increased high voltage.

Remember the radio is older than you are. How would you like it if you were stressed to the breaking point? Well radio parts do not like it either - expecially 50+ year old parts.

Once the S40 is "restored", it should keep running for the rest of your life with almost no further maintenance. It need not be babied or just used on special occasions. Many similar (but more expensive) radios were used in communication facilities and left on 24 hours a day for 30 years before retirement.

You can usually get S40 radios at swap meets for less than the cost of a replacement transformer. I saw one at a swap meet last week that did not sell for $50. The owner was just lowering the price when I went by so I expect it could have been purchased for $25.

If you like the old radios, it is best to start buying as many as you can get ahold of. Soon, you will need a separate building to store them. And, 46 is pretty young to start collecting. Most of the real collectors cannot recall that long ago.

I've been using a 1A quick blow in my S-40A. Hasn't blown in six years of semi-regular use. I used an analog AC current meter to estimate the fuse value. My S-40A would always draw well under an amp except when I was hot switching it. I had some 1A fuses handy so I tried one. I would have raised the current rating if the fuse seemed touchy, but it seems to have worked well.

The radio normally draws something like 60-70 watts. 1A at 120V is 120 watts. 5A at 120V is 600 watts.

Inrush current limiters are thermistors which have a higher cold resistance than thier hot resistance. They limit current surges until they warm up and then they have little effect. In your case, the radio would have been operating and the current limiter would already have been hot. A inrush current limiter would have made no difference.

Inrush current limiters really don't make much difference with equipment which uses a rectifier tube, anyway. The tube gives an even gentler B+ startup than a inrush current limiter. The current limiter might help protect tube heaters. I've experimented with inrush current limiters on both transformer sets and series string sets. In both instances the dial lamps would come up more gently. I don't think they make alot of practical difference with transformer sets, but they might help protect the abused heaters in a series string radio.

If the B+ is higher, the current load on the transformer goes up,
too. That higher current on the HV winding may have been more than the
transformer was built for.

2453. Re: suggested keyer weight for amp tuning

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-21 15:23:05 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <tvdmg.4416$V55.1905@trndny01>
Source record: 12003

Hi, Craig

Sounds like 50% keyer "weight" would be the same as 50% duty factor.

If you have an analog Ohmmeter, you can use that to check
the weight. Assuming the red lead of the Ohmmeter puts out + volts,
connect it to the + keying output ("direct" output
of the MFJ-492), with the black Ohmmeter lead to ground.
With Ohmmeter set to RX100, set keyer to "tune" and adjust
Ohmmeter to zero Ohms. Key the keyer at high speed, 50% weighting,
the Ohmmeter pointer should be at half-scale of the Ohmmeter
with a string of dits.
20% weighting should be 20% of full scale.

If your analog Ohmmeter scale shows 20 Ohms at half scale,
it may indicate about 100 Ohms at the 20% of full scale point.

If you don't have a scope to use the pulse tuning method, do you have
a peak-reading rf Wattmeter?

Source record: 12009

I am trying to identify a Hammarlund radio. The chassis looks like the Comet
Pro variation 3 but it does not have the two knobs on either side of the
main tuninbg knob. When the top cover is lifted, there is a horizontal
bakelite panel very close to the front panel above the main ganged turning
condenser. There are 4 knobs on this panel mounted on the shafts of 4 small
variable capacitors under this panel. The 4 knobs have pointers attached and
there are scales engraved on the bakelight panel. Another difference from
the pictures I have of the Comet variations is a relay installed on the top
of the chassis near the power supply capacitors on the left. The cabinet is
metal with black crackle finish. If it will help, I can email pictures.

Source record: 12011

Hi, I've recently purchased what looks like an old Ex WD unit, with no identity plates, and I'd really like to identify it, I'm sure its a receiver though it could be a converter of some description, quite large front panel 280 by 170mm 300mm deep, centre left of the front panel are three controls marked Aerial RF and Oscillator, each having a little window that clicks round 0 to 9, to the right is a paxolin panel with test points marked V1 to V10, bottom of panel sockets left to right marked RF input, Output, Power Input, Gain control, inside the three front panel controls connect to what looks like a front end box which held two valves marked VR138 and VR137, there are then six IF cans with a single coil inside and six valve holders alongside marked VR65 , something is missing from the top front of the front panel that once connected to the "front end" also right hand side of chassis has a socket marked IF, The "front end coils look about 30-40 mhz (guess) and the IF coils about 7-10mhz another guess, I can send a pic to anyone who thinks they know what it once was, thanks for looking, from Ron g3yuh...

I think the power tranny is ok. The problem is the line bypass caps. CHANGE THEM.

I am looking for the plastic Tektronics cover for this
scope.

Will pay reasonable price for one. Email details.

Thanks

>VR65...

With those valves, it's ex-RAF, probably late WW2 to 1950s vintage.

VR137 is an EC52 low power VHF transmitting triode on B9G base.
VR138 is unlisted in anything I have to hand, unfortunately.
VR65 is an SP61 pentode (100MHz max frequency) on Maxda Octal base.

The EC52 is capable of 7 watts and 300MHz, so it's a transceiver
or transponder of some sort, I'd guess. (Possibly IFF?)

Hope this is some help,

Chris.

Thanks for the comments Ed. Although BAMA was intended to be an
archive of ham and swl equipment, the lack of similar support for
classic test gear led me to include GR, Tek and HP among others. The
fact that the GR gear just added to the collection came from one of
the leading lights of the GR era was very gratifying. I just hope
that the information that BAMA provides keeps some old gear from
winding up in the landfill.

Pure sale, no bidding wars.

Summer cleaning out the shack: several items
(terms at end)

1. (dead on transmit) RF Concepts, RFC 2-317 (2 meter brick amplifier), 30 watts drive, 170 watts output. The transmit side of the amp is dead (looked like power transistors gave out over a few minutes of transmit way back and I never tried to locate someone to fix it; the receive GasFET preamp still works). The manual goes with the brick amp. The schematic says the power transistors (assuming that is the problem) are SRF3897 and there are two of them. Schematic looks like two in parallel (many other transistors, too). RF Concepts went out of business some years ago but maybe one of you guys who knows this stuff would like to have a crack at this repair job. $10 for this unit.

2. Two Hamtronics receiving converters, CA-28 and CA-144. One takes input at 144 - 148 and converts down to 28-32 mHz (and I put a 9 volt battery case inside, and small toggle switch), the other one takes 28-30 mHz and upconverts to 144-148 mHz (I was meaning to listen to 10 meters FM repeaters with my 2 m HT but never tried it). These units do not have as low of a noise figure as the best scanners and newer ham transceivers. Both units to the same address, $35 for both. Otherwise $20 each. With manuals and documentation.

3. Yaesu YS-500 in line wattmeter and SWR bridge for 140-525 mHz. Looks fine, works fine. Max power: 200 w. With one sheet "manual" $30.

4. 440 FM Yagi, 10 elements. I think it might be a Hygain but can't remember for sure. No manual or documentation. It was never outside of an attic. At old OTH it was aimed at one 440 repeater (at present QTH, I have way too many trees and barely can get into one 440 repeater that almost no one uses, so it goes 'on the block'). $25.

---non ham electronics------

5. OPTIMUS (Radio shack) AM/FM STA-795 solid state receiver, with manual and documentation. Works fine. $20.00

6. Night vision device: NV-100/NV-100-1 by Moonlight Products, bought through Edmund Scientifi when it was in business. I need to test it at night before releasing it. I think its a first generation device. Has a large telephoto lens with low f/stop, includes manual and documentation. Runs on two AA batteries, and has its own IR diode light souce if one wants to try that. Has not been used for maybe 7-8 years, but worked fine at the time, and was always stored in a stable non-moist room at RT. Was

not used much when it was used (maybe 1-2 hours, total). I seem to recall reading that these units undergo some deterioration in performance with time, but I don't know if that is independent of whether the units are used or not used. $40

7. Panasonic AG-1830, Video Cassette Recorder, Pro-Line, commercial grade. With manual. Used a lot back 10 years ago, not much since then. It has an on-board frame-grabber, but I have lost the remote control which is how the frame-grabber was activated. Complex controls and relatively thick manual. 17 lbs. Some dust here and there. I have not extensively tested all functionalities, but besides the missing remote control, it was recording and playing back last time I used it. But if you want to receive TV signals and record them, you may need a preamp because the input is normally not very sensitive. I was in a fringe area and got noisy images unless I used a TV receiver preamp. New price over $1000. My price $55

8. Hitachi VHS video camera (portable), VM-2500A, with dead lead-acid gel-cell battery (will not hold charge, won't accept charge). Camera (color) still works fine and records audio, too. It runs fine with an external DC power supply of about 9.6 volts 2.3 amps. This is an old style, over the shoulder unit. With manual and documentation, and some cables (can take output from camera, in playback mode, and feed into a video imput device). I think its never had more than about 20-25 hours of running time. My price $30.

Terms:

If you are interested, send email. I prefer to sell in the continental USA. I prefer to ship USPS, but UPS may be less risky in terms of damage. I prefer USPS money order for sum. Sum needs to include shipping charges which I will estimate, and I'll refund any excess if there is excess. If you want insurance, I'll include that in price. No charge for packaging, handling, which will depend on what item we're talking about and I'll do my best to locate packing materials, especially on biger & heavier items. If we go with USPS, I will spring for delivery confirmation and email you the DC number. You'll need to send the money order first.

I am located in southern Delaware. Please wait a few days before expecting a response. In the event more than one person wants the same item, I will work with the first one and tell the others that they are "backup" buyers in case the first one backs out or something. You need to specify how fast you want the shipping to be; UPS and USPS have several grades of service speed (faster is more expensive). If you have a counter-proposal, I'll consider it. Please give you "ship to" address in your first email to me. On the non-ham gear, I will probably "check" the unit to make sure it is at least minimally functional before shipping.

(see original post farther down)

Update (as of 7:40 pm): I have a pending deal for the night vision scope
and the RFC brick amplifier. If the deal with those interested parties
falls through, I will make an re-announcement.

I forgot one more item: a single pan, digital balance (transistorized),
Its an "Ohaus" model C305, and reads in grams or ounces. It has a
calibration weight (300 g), a wall plug transformer supply, and can run
off an internal 9 volt standard transistor battery. And, yes, the manual
comes with it. It also has a button for "tare" weight (eg. put an empty
container on, press "tare" and it re-zeros the digital readout. The pan
comes off the unit for shipping, and just drops on. I was using it to
weigh letters and small packages. Now I have some new scales for
that. My price: $20.

Looking for above in something like GE, Philips, whatever. Could use a few singles but don't need matched pairs. Not really interested in the new ones like sovtek and don't really want to pay $100 dollar a piece crazy price for them. I really am seeing some of these getting too expensive out there. Thanks for reading... 73, dave austerman

2480. extra cooling for SB-230

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-25 08:15:08 UTC
From: Craig <caheaton@netzero.net>
Message-ID: <550c2$449e4608$4831d174$7067@FUSE.NET>
Source record: 12030

Hello, I recently acquired an old Heathkit SB-230 at a local hamfest and in the interest of keeping that old (and EXPENSIVE!) tube alive for as long as possible would like to add a bit of extra cooling. Would resting a muffin fan on top of the cabinet be preferable to blowing air across the heatsink? Also, if on the housing, would sucking the air out of the cabinet be superior to blowing in? (I'm assuming the former as this is what works best with my computer). I might even do both....plenty of muffin fans lauing about not pulling their weight! hi hi

Hi Chris
My mistake the other valve is a VR136 not VR138 the unit is a bit
tarnished, strange that transmitting valve is there? I can't believe
its a transmitter, or transmits in any way, there is no change over and
the controls and connections are real simplicity, it looks like a
straightforward simple HF receiver? Anyway thanks for the info, I guess
by the lack of replies its an unusual one :(
cheers
from Ron...

Might be a radar receiver of some sort with those 6 IF stages. Should be
able to check them out with a grid dip oscillator to see what frequency
they are on. 30MHZ???

My data books shows the VR136 equivalents as a CV1136 or CV380.
Civilian equivalents are the EF54 or RL7 which are a sharp cut off
pentode used as a UHF Amplifier. Base is European 9 pin lock-in type.

VR136 is another B9G base, and is an EF54, again with a maximum operating
frequency of 300MHz.

I'll have to dig out my Yeeha! password and have a look at the photo.

One thought: if it's steel-cased it's probably ground based kit, as most
of the airborne stuff was aluminium to save weight.

Chris.

> Craig KB8FGC

The single largest cause of tube failure will be grid current. That amp
really needed a grid trip circuit to knock it off line if current got
too high.

Unless you provide grid current protection you won't make even a small
change in tube life. 10 seconds of too much grid current and the tube
is history. A fuse WON'T work. It has to be a fast electronic circuit
since damage is accumulated as gold is evaporated from the grid.

As for other changes, add a series resistance between the supply HV and
the plate choke. You really need about 20 ohms and a HV type, like a
175P pulse rated RCD power resistor or a glow-bar composition type.

If you want to increase cooling, use a muffin fan on the heatsink.
Blowing is generally more effective. It will not require much airflow.
All you really gain from this is increasing duty cycle before the
thermal overload trips out. It'll also reduce deterioration of the
components around the tube over time, but it will make virtually no
change in tube life.

I don't see how you could think the widow is being "ripped off".
It's an auction and will sell for the highest bid.
If they wanted more they should have shopped it around and tried
to find someone that would premium for it instead of putting it
up for auction.

You're always boasting about how much money you've got (and releasing
a lot of Freudian Slips that reveal your insecurity when you keep
expressing how you wish everyone else was jealous of your money)
so,
why not put your money where your mouth is and immediately
bid £10K for it?

Or is this to be another case of, "Do as I say, but not as I do"?

Surely your chronic need to seek attention (which you project
onto others) will be sated by being known as such a generous fool?

Don't use this amp in a contest, even with a muffing fan, I could smell the wax oozing from the power transformer. Switched to a SB-220. Good durable amp if proper care is taken.

How can anyone be "Ripped Off" if it reaches the reserve price?

If it is worth more, then it should be sold elsewhere.

Hi Chris
Thats a good point! its very heavy all steel construction so as you say probably Land based, I have tried to GDO the front end coils, and get a good dip on the RF and Osc coils around 38 mhz, The antenna coil I can't find a dip although the coils look very similar in all three stages, So what would a fairly high gain fairly fixed freq receiver be doing on a military airfield during WW2 with a VR138 in it?
By the way I noticed there is also a valve diode base in the front end similar to an EA50 type I would think and another at the end of the IF chain
from Ron...

2497. Hallicrafters SX-101A Restoration Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-25 18:13:56 UTC
From: Jim Barnard <jbarnard@ftc-i.net>
Message-ID: <e7mjp1$p74$1@news04.infoave.net>
Source record: 11947

I am in the processing of restoring a Hallicrafters SX-101A model MKIIIA.

The big black dial bezel on this radio has a smooth flat black finish. I all the pictures that I have examined on the Internet, the bezel has a black wrinkled finish. In disassembling the bezel from the front panel, it looks like this was original because none of green painted on "screw seals" appeared disturbed.

Is this correct for this model or has someone done a masterful refinishing job at some point in the past?

Thanks for any suggestions/comments.

Jim

Well, I have no idea what these things are worth. So Brian, maybe you could give me an idea?

ï¿½1k seems a lot of money in any case, unless they are really that collectable.

Why didn't you put in a higher bid and either enjoy it or sell it on?

Steve

Radar receiver? The early stuff worked in the 20 - 50 MHz range, and
they might have used a fairly chunky valve as the RF input stage to
protect things from the substantial transmit pulses. Alternatively
it may just be the LO because it was a convenient triode that would
work at the desired frequencies (and the VR136 is the RF preamp).

>By the way I noticed there is also a valve diode base in the front end
>similar to an EA50 type I would think and another at the end of the IF

AVC and detector? Dual AVC? If the IF strip is single coil, it's
probably wideband for pulse use... another clue to radar applications!

Best,
Chris.

Facts about the Spy set auction on Ebay for a Silent Key sale by
Delightful_Little_Lady who set up the auction.

All the radio kit from the silent key was purchased by The Bredhurst
Receiving and Transmitting Society (BRATS) of which I am a member out of
club funds for £500.00 to immediately allow the family to pay for expences
that were due. The BRATS were to be paid back their £500.00 and any profit
that the members made above £500.00 by selling the equipment would be paid
to the family. If this figure was not achieved The BRATS did not expect
their money back.

The BRATS were given 2 agendas by the family of the silent key.

One was to sell the equipment to raise enough money to at least pay for his
funeral. The couple were so distraught that my husband arranged the cheapest
funeral he could for them.

The second agenda was a plea from the family to get rid of the large amount
of equipment from their premises AS SOON AS POSSIBLE. We are talking one
garage load and one large room of equipment that had been collected by the
amateur over 40 odd years. Quite a task in anyone's books.

The Radio Club (The Bredhurst Radio & Transmitting Society), of which I and
my husband are members appointed my husband Charles G4VSZ to take over the
advertisements of the equipment to 9 local Radio Clubs in the area. This he
did by setting up a Website to offer the equipment that was the most
valuable. The B2 was the most valuable piece of equipment belonging to the
silent key. This was offered on the website and anyone could have telephoned
us on our number, which is in the telephone book, emailed him to offer a
firm bid on this item. NO ONE came forward from any of the clubs we
contacted with a bid. However, quite a few people said put it on Ebay.

I reluctantly offered to put it under my Ebay name as I have over 1000 positive feedbacks. I say reluctantly because it meant a lot of work for me and as usual people were coming up with plenty of suggestions but no solutions. Charles and I also said that if it did not sell we would put our money where our mouth is and give £1,000.00 for the set. I was then able to start the auction at £1,000.00.

I made the auction a private auction to stop timewasters putting in bids in the last minutes and then not paying. I had 8 people who asked to join my bidders list and of those 3 made bids. The radio has now sold for £1,776 to a London bidder who I will keep anonymous as per the auction description. I am paying the fees of this sale on Ebay myself.

The family can more than pay for the funeral and are delighted and overwhelmed by what the Bredhurst Receiving & Transmitting Society (BRATS) have done for them.

If, like usual, there is no comment from the perpetrator of this thread when faced with the truth about something. I will take it that my Ebay name has been vindicated on this newsgroup. Sorry is not a word in his vocabulary so he usually goes silent instead. If, however, he is attention seeking again, and in his usual mood for twisting the truth to suit himself, I can assure this will be my only posting on the subject, as none of my family want anything to do with this man, especially giving him fuel for his massive ego. Jean Darley G1DLL Delightful_Little_Lady on Ebay.

2505. Heathkit SB-1000 amplifier kit. Unbuilt.

I have acquired a Heathkit SB-1000 amplifier unbuilt kit. Before I
decide to build it or sell it, would
like to find out what it would be worth in an unbuilt state. The main
box had been opened and the
manual removed for reading., the other inner boxes have not been opened
or anything else removed.
It also came with the QSK kit which was an option from Heathkit (it was
factory assmebled). Please
contact me off list.Thanks for reading. ....dennis ve6ac

Ok, Ok...I guess no one has a 3 5 4 6 +/- 1 KC crystal they wish to swap, so maybe there is someone out there with ANY FT-243 or Z-9 crystal that falls in the lower 100 KC of 80 or 40 meters they'd like to trade for a brand new 3946 kc crystal? My preferences are 3542 to 3560 or 7030 to 7055 kc . The 3946 crystal is brand, spankin' new and in a Z-9 case with 0.092 pins so it'll work anywhere an FT-243 does. It's a Petersen Radio crystal. Tanks!

Hi Smokey,

What do you suppose the odds are that someone who is running rock bound on 80m, is going to need the exact rock you have, and have the exact rock you need? Especially given that yours is in the middle of the phone section?

I checked through my FT243's, and unfortunately, they have been thoroughly picked over for 80 an 40m rocks.

Give JAN a call. I am sure that they still have gobs of FT243's in their scrap bin. It couldn't possibly cost more than $25 to get one custom ground to meet your needs.

-Chuck Harris

Jean, I've nothing to apologise for. I stirred up interest in the auction, contacted VMARS (check the EMails in circulation) so the true item was known (much more that the original offer), and it appears that a far more sensible bid has been made. I hope the family are happy and I wish the new owner of the B2 set well, whoever he is.

As for the rest, I think is terrible that you seek to use the death of a well liked local amateur to ferment a one sided row that has resulted in one of the BRATS with a police caution for harassment.

I will not comment further here, out of respect for Peter and his family

Brian

Call ICM and order one for fifteen bucks or so. It's not that big a deal
to get crystals made.

The alternative is that you can skew the crystal you have to a higher
frequency... it's harder to move it lower than to move it higher, though.
But grinding it down with Ajax cleanser is not that hard a thing to do,
especially today when you can just stick it in a little Pierce oscillator
with a frequency counter and see where it's moved to in a second.

Jeez...I can get crystals; why are you guys so defensive?. I'm simply looking for someone whose got one to swap that is interested in one I don't need.

By the way...if you are paying $15 to $25 for crystals you are not shopping very wisely.

I'll worry about my crystal issues/ I don't need lectures.

It says the auction end price was £1,776. It may be under priced or it may be the market price.. I don't know, so was someone genuine blocked from making a bid? Armed with that information they may have a valid point... otherwise how come they never bid on it themselves if it was so valuable.. or did they?

Wanted. A nice example of this fabulous RCA wartime receiver. Would really like the version with the S-meter but maybe that's too optimistic! Will make do with the D or the LF!

Reply on here. I am in Australia, so will not have to use a C5 to move it!

Dunno, can't remember ever seeing one of those as a power amp.
Usually they were the local oscillator for VHF kit. I don't recognise
the stuff as described, but the Gee nav receiver had a similar valve
line-up if my memory is right. The main chassis was the R1355, with
6? SP61 IF amps, and the RF26/7 plugins were EF54 RF, EF54 Mixer, EC52
LO. Suggest a repackaged Gee rx to the OP. Tuned 20-70 Mc/s, IF
7Mc/s, again trusting my memory.

R1355 wasn't much use for anything, save that the RF26/7 units were
stripped down for the very well made 2 gang and single gang 75pf
tuning caps, and the Muirhead epicyclic drive. Many amateurs bought
one of the RF2?-25 plugins for a lifetime's supply of 30 pf beehive
trimmers, I'll be leaving half a dozen beehives to my heirs.

Source record: 11972

Hi
I just got a National NC-183D Receiver
It was sitting for a few years.
I turned it on and it seems the RF gain is low.
As you turn up the RF gain nothing is heard til you
get up to to the number 8 on dial.
So no receive until you turn dial up to 8 and I turn it up to 10,
I hear signals on AM SSB fine. But need to get the RF gain higher
so signals come in stronger.
The glass tubes seem to be on.
Can it be the tubes or something else?
It seems to receive all bands but 40 Meters.
Thanks for reading
Rich NJ

Rich,
Having restored both an NC-183 and a "D", I found that re-capping was mandatory in both cases. Its not a bad task, given that these receivers are fairly open and accessible, below the chassis. I found that the electrolytics in the power supply and the audio stages were either totally shot or leaking badly. I'd also suggest checking all the tubes. One or two weak ones can certainly degrade the whole receiver. If an alignment is found to be necessary, note that the front-end inductors in these rigs are not easily tuned; they use mechanically repositioned loops (the book explains all). Finally, I highly recommend running the set on 110v rather than a higher line voltage. The power xformers in both my 183's get (I think)abnormally hot above 120v. In fact, I run the entire collection of boatanchor rigs via one of two 15A variacs installed in the ops room. Its quite amazing the drop in temp rise of all the equipment and I'm convinced that their longevity has been increased.

First, my thank you's are in order to all who have answered my posts concerning this amplifier...I have not yet fired it up, but I'm getting there! (Taking it easy and following the good advice I've received). Anyway, I've browsed the Heathkit manual and their instructions for tuning the amp seem rather complicated....they tend to focus on tuning for output and very specific plate and grid currents. Would it be safe for me to instead use the following procedure (which is likely to get me to the same point, but is easier to remember....it's the technique we used t for the old club amplifier):

1) Turn on amplifier (of course) and allow it to warm up.
2) Set exciter for 80 watts output on cw (amp is supposed to take 100 watts, but I want to be on the safe side).
3) Set pulsed tuner aid so that I am running about a 25% duty cycle (average power into amp will be 80 watts peak, but only 20 watts average).
4) Set amp tune and plate controls to suggested starting points.
5) Switch amp out of bypass.
6) Tune amp "Load" for max power out, adjust "Tune" to dip plate current, check grid and plate currents.
7) Increase pulsed exciter power gradually while repeating step 6.
7) Repeat step 7 until desired power out is achieved (keeping in mind that I need to stay well within allowed grid and plate currents).

In a nutshell, that's how I remember tuning our club amp (although it was near 20 years ago when I last tuned one.) Does this sound about right? It seems much faster than the steps outlined by Heathkit and safer too...also, would there be any problems with my signal if I keep the exciter power fairly low...say at around 50 to 80 watts rather than the 100 watts specified? (Granted, my output power will be lower, but that is fine...especially while I'm still just testing the amp and if any RFI will be generated by the amp.)
Thanks a bunch!
Craig KB8FGC

I might even forget the pulser, and just use pure CW and start at 20 watts
of pure CW until you get the feel of "amp on" vs. "amp off" and the
effect of tuning.

> 4) Set amp tune and plate controls to suggested starting points.
> 5) Switch amp out of bypass.
> 6) Tune amp "Load" for max power out, adjust "Tune" to dip plate
> current, check grid and plate currents.

I would recommend setting the loading control far CCW to start (i.e. low),
and tune the plate for maximum RF output. You may or may not see much of
a "dip" in plate current as you go through resonance (depending on what
"class" the amp is really running in), but you should see RF output go
from zero to something high.

> 7) Increase pulsed exciter power gradually while repeating step 6.
> 7) Repeat step 7 until desired power out is achieved (keeping in mind
> that I need to stay well within allowed grid and plate currents).

Another issue you left out but you need to watch is what the SWR is
between the amplifier and its load. Quite a few of us (including me) use
an antenna tuner between our rigs and the transmission line. You almost
don't care what the SWR is between the tuner and the antenna, but on the
coax between the rig and the antenna tuner, you better be low (i.e. SWR
2:1 or lower, depending on the rig) instead of high (i.e. 3:1 or more)
because that reflected power will end up being dissipated in the
tube/heatsink. And, another thing: once I was a little off resonance on my

SB-230 and after transmitting for 1-2 minutes, the overtemp relay kicked in and put the amp into bypass until the heatsink cooled off (this will take a few more minutes, maybe less if you put a small fan on it) at which time the bypass kicked off and I had power again (leave all the switches on). So, you have to watch your plate resonance. If you raise loading, always recheck plate resonance.

Not a bad idea until you get a feel for how the amplifier behaves in tuning, how your lights dim on voice peaks, whether your circuit breakers/fuses blow when you talk up the amp (have a flashlight handy at night?), etc.

Desperately need a plate meter for my Drake L4-B that followed me home a few months ago. Can still tune it with grid current and W4 watt meter, as I've been around this racket for over 50 years.

Thanks for any help you guys can offer

K5VSE/Mike

2541. Repairing a BC-348 - An update and a few more questions....

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-06-28 02:25:05 UTC
From: "H. P. Friedrichs" <noemail@please.com>

Hello, folks.

I couple of weeks back, I posted here about an old BC-348Q I had started work on. So far, I have:

a) replaced the tubes (found one open filament and some weak tubes)
b) rewired the filaments (including errors introduced by a past owner)
c) recapped the set
d) found several bad resistors, leading me to re-resistor the set
e) repaired the BFO
f) replaced mouse-eaten wires
g) dismanted the "dead" filter crystal, soaked/cleaned it in alcohol, and reassembled it
h) replaced intermittent BFO and Filter switches
g) aligned the set, as per the service manual. (alignment was way off...apparently somebody went around "adjusting" slugs and caps helter-skelter.)

Nifty set, and it seems to work fairly well now, from one end of its span to the other. I do have a few observations and questions I wonder if you'd comment on.

1) I notice some apparent variation in sensitivity from band to band. Is this normal, or am I looking at the possibility of leaky caps inside of the RF compartments? (If the latter, I may just let this be for now. I don't relish the idea of trying to get those rf boxes out of the set!)

2) Tracking is a little bit off as far as dial calibration, despite repeated attempts at alignment. I wouldn't expect digital frequency display accuracy, but is this typical of this set?

3) The crystal filter works, but the insertion loss is significant. Am I still looking at a crystal that is not quite up to snuff? Should I try having a new crystal ground and install that instead? Or, is this normal? ---Side note: Why is the crystal element so darned thick? I have 32khz realtime clock crystals in the junkbox that are slivers compared to this 915khz filter crystal....and that filter crystal has got to be an 1/8 thick!)

4) I have been running the set from bench supplies, and would now like to build a power supply module to fit where the dynamotor used to go. I have been running the set with 150 volts on the B+. Somewhere I read that I should not exceed 200 volts. What is the appropriate plate supply for this radio?

Thanks for the help.

Pete

Pete,

Sounds like all of your efforts are paying off! Lots of work,
but it had to be done.

The original DM-28 dynamotor put out +220 VDC for the plates.
Sounds to me like it's OK to exceed 200 VDC. Running the set
about 70 Volts low on plate voltage could account for the low
sensitivity.

I have an all-original BC-348-R that I picked up at a recent
hamfest. It's complete and in nice shape, but it's missing
the dynamotor. I need to locate one because once I have the
set restored and working, it's going aboard our Museum's B-17
Flying Fortress (which means it has to run on 28 VDC). Any
leads will be appreciated. I'm also in need of a BC-348-R
manual. Apparently the "R" model is different from all of
the previous models, although I don't have a clue how.

73,
Dean K5DH

Early models of the 101 including the straight 101 had a flat black
bezel. Only the later models had the crinkle finish.
I'd have to go out and look but as I recall the 101A and the MKIII
have a number of differences including the bezel finish, frequency
coverage, and main tuning knob.

Craig,
If it were me I would follow the Heath Kit instructions. I built that amplifier in 1976, still have it. I have run it at 500 ma for many years with it still putting out max power. I have had to replace the power supply filter capacitors, other than than been a good 600 watts output amplifier. While it might take a little longer to tune up, once you know what the setting should be for a given frequency, you then can preset those and save yourself alot of time.

Craig...At one time I had 4 SB230's
Now I have one on hf, and one converted to 6 meters.
Either tune by the book, or tune for maximum output....either way, just do it fast.
The only big mistake to your steps I can see is not to start at 80 watts....that is close to full drive.
I would say to start at around 20 watts.
Make SURE the SWR that the amp sees is reasonable. ...less than 1.8:1 or so....If you have a tuner in that path, make sure it can handle the power....nothing MFJ!!!

Key down your rig while watching the amps' RF output and spin the plate knob quickly each way to find a 'kick' or peak in output. At 20 watts drive, I'd expect 150 or so watts out. Stop transmitting, and wait 5 or 10 seconds. Now is the part that you only learn from experiance....it'd be nice if you were doing it with a TS520's 6146 final....instead of an unobtanium 8873....But....
you need to transmit, and tune the load control while simultaneously juggling the plate control. All the while looking at the wattmeter for more output. At some point, rotating the load and peaking with the plate will NOT end up in more output. That is where you stop.
Now you can increase power from the rig to whatever you want...but the load and plate will have to be 'touched up' again with the increased drive.
Pulsers are kind of a waste. Someone who has used an amp for a while should be able to tune it up in 2 or 3 three second transmissions. If you are playing with knobs while key down for 15 to 20 seconds, you shouldn't own an amp!!
...Dave

==========

Pete:

Some variation in sensitivity from band-to-band is to be expected, but some of it may be a alignment/tracking problem. All the BC-348 versions I have worked on have a dial calibration error in excess of the specs. The RF and Oscillator coils have trimmers to adjust the high-frequency end of the bands, but only the LF band has a low-frequency adjustable padder. The padder capacitors for the high-frequency bands are fixed micas. The coil forms and perhaps the micas have aged over the last 60+ years and caused the low-end calibration to be off. There are a lot of small mica capacitors inside the "coil cans" and many of them are non-standard values. It is probably not a good idea to mess with them. I "fudged" the coils on my BC-348-R and got the low-end calibration on spec, but it is a slow, painful process. But, once done, the alignment has stayed put for the last 5 years or so. It is one of my favorite receivers.

The size of a crystal is a function of frequency and the mode of vibration. The BC-348 crystal is a thickness mode crystal is much larger than a tuning-fork type crystal used at 32kHz. There is some loss in the crystal filter, but not much. Sometimes the extra selectivity reduces the sidebands to the point that the sensitivity seems to be reduced, but the carrier remains strong. I assume you aligned the IF at the actual Xtal frequency.

Running your BC-348 on something around 200 - 220 VDC should be OK. I wouldn't go above 220. There would be no advantage to that. Putting the power supply inside the cabinet of the receiver will raise the temperature a good bit and raising the B+ above 220 will raise the temp even more. I always recommend an external power supply. Put it in the speaker cabinet. Your BC-348 will be a lot happier that way and more stable too.

Best Regards, Ed

Another "Old Wives Tale"! Tubes are only "matched" to the point where the desired output is obtained. Reflected power will see the amp as a mismatch and will again be reflected back towards the antenna.

Not a problem anymore. I turned it on this morning and it was working. Now I think it's the relay contacts. Will have to go out to the shop and double check the diagram, but I'm pretty sure it goes thought the relay.

Thanks to everybody that answered my request.

Mike/K5VSE

I'd like to add one item to Dave's post below for caheaton's benefit:

If you don't have a 50-52 ohm dummy load (pure resistance, dry or oil,
whatever, but with capability to handle 100-200 watts of dissipation for
at least as long as you will be spinning those knobs), please get one.
And, learn how that amplifier tunes up going into a known, low SWR dummy
load (your SWR meter is between the transceiver and the amp). Your antenna
tunner (which is between the amp and the antenna feedline) shoud be tuned
up for low SWR _BEFORE_ you turn on the amp. After you know the SWR is
low, then turn on the amp and drive it with, say, that 20 watts of
carrier, or with the microphone gain turned down. Once you are statisfied
that the SWR is low with/without the amp in the circuit, then you can
crank up either the carrier (alone) for touch-up tuning, or crank up the
audio gain (and watch the room lights flicker, etc).

And, I'll go along with the recommendation below to do the tune up pretty
fast.

All depends on your definition of matched.

Reflected power will see the amp as a
> mismatch and will again be reflected back towards the antenna.

I think that is only partly true. Yes, there will be reflectd power going back out to the antenna, but there was an article in QST back a number of years ago. Yes, the mismatch also results in higher plate dissipation, too. I will correct myself about reflected power being disipated in tube, but the mismatch will increase the plate dissipation. The other issue is being off plate resonance. I had my SB-230 trip the overtemp relay when I moved frequency and did not retune the final.

You also need to allow for loss in the transmission line. Not all of what gets reflected at the mismatches ends up at the other end of the transmission line. SWR (i.e. reflected power generated at the antenna/feedline) would not be a problem if the transmission line were long and lossy.

Check your RF gain control. Sounds like you might be using an audio taper pot where a linear taper pot is required. If you've got the correct taper maybe the pot has gone out of its design curve. I have experienced this on a couple of vintage receivers. I had one that responded just like yours...no gain till "8" or "9" then lots of gain. I also had one going the other way, near full volume by "2" or "3" then little increase. Replacing with a fresh proper taper pot corrected both.

Another pot anomaly is where the increases normally as your rotate the pot then you hear a little "pop" and the volume goes high or low. Pot problem that (often) contact cleaner will not fix. It's mechanical and often dependent on the taper that was designed or has developed over the years due to wear, age, dirt etc etc.
Good luck.

Smokey

Pete, I'll add my 2-cents worth. Info on the B+ spec posted is, of course, correct. Remember, though, that B- floats and is NOT at ground potential. B- has its own connection. One thought, and its helped several sets I've owned, is to bypass the "gain leveling" pot attached to the end of the tuning capacitor. The idea was to vary the gain from one end of the band to the other. I've found it to be more of a problem than an answer.

In my opinion VOIP and amateur radio shouldn't be mentioned in the same
post.

VOIP is a simple process of sending priority voice packets over the
internet, almost the same as just as any data packet is sent. It has
nothing to do with ham radio unless you want to use it for a patch.

By the way, you mention "almost null cost." Why should there be any cost at
all if you own a mike compatible with the sound card?

Are you a ham, or just a spammer for voip?

Back in the sixties, CQ ran an article about DX'ing by telephone,
actually I think there was a followup, including a photo of a DXpedition
using a remote phone. I can't remember if it was explaining the joys
of this, or a warning that it was a conspiracy from the telephone company.

Of course, the article or articles ran in an April issue, and of course
it was an April Fool's Day article.

Thanks again to the group for all the advice. Yes, I had planned on making sure the antenna was tuned before hitting it with the amp (guess I should have mentioned that). The tuner I bought should take the power okay...recently purchased a used (but in great shape) Nye Viking MB-II. I also have a Heathkit Cantenna dummy load (with oil) I purchased at the same Hamfest, so I should be all set in that department. I've also run a dedicated circit for the amp (240 volts) and while I was at it ran a dedicated 120 volt circuit for the rest of my shack's equipment....so at least the amp shouldn't be dimming the lights! :-)
Thanks again and please keep up the discussion....I'm absorbing all of this collected wisdom and will blend it to form my own procedure....hopefully none of this will be for naught!

I'd like to add a few comments and retract one statement I made in an earlier post (and explain why I'm doing that). The retraction: I said something to the effect that (substantial) reflected power is not good for the amplifier because it will cause dissipation of extra heat in the tube and the tank circuit. I'd like to correct myself by saying I'm not sure if that is true or not (one guy said it was an "old wive's tale", and then I thought about it for a while and decided to add this comment that I am writing now. Walter Maxwell wrote a series (at least seven installments) of articles back in QST in 1974 or so (I have all seven, but it was indicated that there would be more installments). These were all very very very technical articles dealing with SWR by a very very very sharp guy. I re-read almost all of these articles last night to brush up on the problem of SWR. And, I remember most of his points and I accept almost all of his explanations. Its impossible, in a few sentences here, to summarize this very complex and widely misunderstood and un-understood topic (going by my own re-review and what was said in the articles). However, someday you might want to delve more deeply into an area that _may_ be better understood by the "experts" (i.e. the electrical engineers who go into the mathematics, equations, definitions of characteristics that are generally way beyond us amateur amateurs). I will mention the following which is my own "tentative" "understanding" (which I admit is incomplete).

1. Maxwell mentioned several other publications which agreed with his interpretations and several other publications by other guys who were also very very very sharp guys who held a viewpoint different from Maxwells. Hence, there remains in my mind questions about what is really going on in transmission lines.

2. Once I had an SB-200 amplifier (in the same power class as the 230, but with two 572-Bs instead of your 8873) and I had the peculiar situation where the SWR was 3:1 (no tuner), and the amplifier was showing proper plate voltage and current and the plates of the tubes were glowing red hot (not good). I was not in a position to analyze this situation except to note that there were a lot of conducting metal near the antenna and that may have made the SWR higher than it should have been AND caused the tube plates to overheat (no damage was done to the tubes since output was still OK).

3. There is a notion that RF going out a transmission line and encountering a mismatched antenna will be partly absorbed by the antenna and partly reflected back towards the transmitter/amplifier. Most people are afraid of that reflected power. Maxwell, and other genius-whips, say that when that reflected power comes back and hits the matching network between the amp/xmtr, all of it gets re-reflected back to the antenna (I saw nothing in the text that says part of it gets reflected and anther part gets absorbed by the amp/xmtr, so that implies that he says it all gets re-reflected back out to the antenna. So, what is bad for efficiency in transfering RF from the amp/xmtr to the antenna is transmission line loss which absorbs (attenuates, db/100 ft) RF on the way to the antenna, and attenuates again the reflected power, and attenuates again the re-reflected power going back to the antenna. Presumably there are an endless re-re-re-etc-reflections every time the RF goes out the end of the coax and into either a tuning network (at the amp/xmtr) or the junctino entering the mismatched antenna. So, if you use a low loss (=low attenuation) coax, then it doesn't matter what your SWR is.

One observation I've made that is consistent with Maxwell's prediction is that if I de-tune my antenna tuner from its lowest reflected power level, then _both_ forward and reflected power go up (this is not inconsistent with Maxwell's prediction that RF coming back from the antenna is re-reflected back towards the antenna, thus making the forward power go up because it includes not only transmitter output but the re-reflected power that goes in the same direction (back out to the antenna).

One observation that is not consistent (unless someone here wants to help me better understand this) is that most of the new (solid-state) rigs coming out have some kind of "SWR" fold-back protection that causes output power to become reduced when SWR goes higher than some threshold. A few cases of powering into wrong antennas has caused some of my gear to shut down. In one case, using my old Icom 707, detuning my antenna tuner from SWR 1.1 or nearby caused my Icom power output (as measured on BOTH the Icom output meter [whatever it really measures, the manual does not say] and the forward power needle on the double needle SWR meter on the antenna tuner) to cut back, automatically , when SWR goes over 2:1 and hits 1/3 of

whatever maximum is when SWR hits 3:1. The manufacturers put this protection into these circuits for a reason. Maxwell's article was written before solid-state broadband, fixed 50 ohm output impedances were established in all these new rigs.

I think at one time I did put an SWR meter between the amplifier and the tuner, and another SWR meter in the feedline between the tuner and the antenna and demonstrated to myself that I could adjust the tuner for low SWR between the tuner and the amplifier but the SWR in the feedline between the tuner and the antenna was unchanged. This is consistent with Maxwell's predictions. And, you might "think" about all this as you play with your rig. For a lot of us, we, after all, want to play with our rigs more than we want to actually understand them (technically), and after all, it _is_ a hobby.

Getting back to running your rig (xmtr and amp), I'd say that the practical advice is to have your antenna tuner adjusted for preferably lower--as low as you can get--reflected power on that coax between the xmtr/amp and the tuner. Maxwell would say tune the amp for currents and voltages appropriate to the tube's manufacturer specs AND for max power radiated (you would need a field strenght meter [a small antenna, sensitive meter, and diode--it does not have to be complicated], but then you can go overboard on all of this stuff).

Finally, I don't recall you mentioning if you have had much experience tuning antenna tuners. The instructions are often incomplete and you sometimes can't just turn one knob for minimum reflected power and then the other knob for its minimum reflected power and then stop. What you have to do is go back to that first knob and move it, one way or the other, a little bit (raising the reflected power a bit), then go back to the second knob and see if the new dip in reflected power is higher or lower than the first time you adjusted the second knob. If the dip is higher, then you are going the wrong way with the re-adjustment of the first knob (so go back and re-adjust it the other way), and then adjustment of the second knob should get the reflected power down farther. Sometimes on some of my antennas, this adjustment "cycle" is quick and easy, and other times on other antennas it takes a lot of critical adjustment and many cycles back and forth.

Its interesting in Maxwell's articles, that in the last installment that he wrote that I have (#7 in the series), he finally gets around to having a typical xmtr/amp->transmatch (tuner)->feedline->antenna and talks about getting the SWR down as low as possible even though he is "fighting" this in all of the other articles. I think he is at least mostly right about all of the surprising things he shows us we all misunderstand (I know I did) about SWR before I read the series of articles. However, I also sympathise with the notion that we do want to play at our hobbies rather than make "school" or "work" out of them, so I'll wish you good luck and don't overworry about hurting that amplifier. You may blow the tube someday and that will cost a bunch to replace, but play with it first and enjoy and learn how all the knobs work and get comfortable with how it all

tunes up and what you get out of it in the process.

6SN7's are twin medium mu triodes in an octal package. They are used as preamplifier tubes, and as phase splitter/driver tubes for Push-Pull output stages in audio amplifiers. They are huskier, though roughly similar to the 12AU7.

What are they worth? Whatever you can get for them. They are worth little or nothing to me... lots more to others.

Art, consider it this way, if you have high SWR, you are driving
a load that is the wrong impedance for your transmitter. Suppose
we were talking about an audio amplifier that was designed to drive
an 8 ohm speaker. If we drove a 1 ohm speaker, would you not expect
the audio amplifier to be over loaded? Perhaps a little hot around
the collar? If we drove a 1000 ohm speaker, the amplifier would have
trouble generating enough voltage to get any significant power out to
the load.

Art Maxwell wanted to drive a low VSWR load because he was using
coaxial cable, and as the VSWR increases, the cable sees higher
voltages and currents inside of it than it will see at a 1:1 VSWR.
These higher voltages and currents will cause cable heating, and
a loss of power to the antenna.

If one was using a high impedance ladder line type of transmission line,
it wouldn't much matter what the VSWR was, but not so for coax.

If you read Walter Maxwell's articles, you would see that by his explanations the sentence you just wrote is wrong.

Suppose
> we were talking about an audio amplifier that was designed to drive
> an 8 ohm speaker.

I have measured the DC resistance of many 8 ohn speakers and they always show less than one ohm of DC resistance.

If we drove a 1 ohm speaker, would you not expect
> the audio amplifier to be over loaded?

Would you care to specify what you are driving that "1 ohm speaker" with? DC, AC (complex waveform, sine waveform, square waveform)? Duty cycle? How much voltage? Would you care to specify whether that speaker is heavily coupled to the atmosphere or lightly coupled? If the speaker were in outer space, what "X ohms" would you expect it to be?

Perhaps a little hot around
> the collar? If we drove a 1000 ohm speaker, the amplifier would have

>
> Art Maxwell

I don't know any Art Maxwell, but the author that I talked about was Walter Maxwell.

wanted to drive a low VSWR load because he was using
> coaxial cable, and as the VSWR increases, the cable sees higher
> voltages and currents inside of it than it will see at a 1:1 VSWR.

Walter Maxwell included a substantial amount of historical information regarding the fact that amateurs used open wire feeders for decades before coax came out and that all these guys didn't know anything about SWR but when SWR was discovered, it was also discovered that all of these guys were very effectively communicating under conditions of very high SWR and the reason it didn't mean anything is tht open wire feeders have very low losses, generally even much lower than good coax. I have seen attenuation figures in the older editions of the Radio Handbook. Its true.

> These higher voltages and currents will cause cable heating, and
> a loss of power to the antenna.

I once ran a 100 watt output 440 mhz brick amplifier to a 440 mhz beam with 1.2-1.1 SWR through a 50 foot length of RG-8/U on FM and the cable, during the course of a 30 minute two way QSO became a good 20 degrees warmer.

> If one was using a high impedance ladder line type of transmission line,
> it wouldn't much matter what the VSWR was, but not so for coax.

According to Walter Maxwell, it does not have to be high impedance ladder/open wire. And, what does matter is that the transmission line, regardless of its characteristic impedance, be low loss. I think he is right.

A couple things I found when I reworked a BC-348R a couple years ago....

1. A previous owner built a power supply on the bedplate for the dynamotor, and hooked the outputs up the same way as the original power supply. He ran the power through the AVC-OFF-MVC switch, just as it was when the dynamotor was in place. When the set was designed, +28v to the switch, ground to chassis. On my receiver, it was now one side of the AC line running to the switch, the other side to ground. I found this out rather spectacularly one day when I touched the chassis of the receiver, and brushed up against something grounded. This engendered a complete circuit trace to determine the problem....my (temporary) fix was to run the cord to the primary of the transformer with no switch...a little inconvenient, but better than getting electrocuted.

2. I didn't see any mention of this...you may already know this, but just in case...those plastic capacitors on the component boards are actually paper caps, with all the problems inherent therein.

They are common twin-triodes that appear in a lot of audio gear, including church organs. The Raytheon units tended to have more heater-to-cathode leakage problems than the other American types, but definitely have less than the modern Russian ones.

Since the Russians currently make an excellent 6SN7, I think the market for old pulls is somewhat limited. But throw them up on Ebay and see if anyone bites.

Octal tubes of that age typically range 3 to 5 $ when new. But you are lucky as the 6SN7 is one of the tube which falls in the "audio" category. That is the category of the hi-fi aficioados who believe that tube audio amplifiers are better than the solid state one, and are prepared to pay quite a lot for them. That is the reason why US-made 6SN7s are typically sold 15 to 20$ when new.

I would advice to advertise your tubes on e-bay in the section dedicated to hi-fi aficionados, not in the electronics one.

The used audio tubes price could be close to that of new tubes, as those people do not understand the difference too well. Insist on the fast that the used ones are better than the new ones, as they have been thoroughly tested.

Stress a lot that they are matched, and that they are US made, not coming from eastern countries.

Also, try to find some distinguishing feature of your tubes, like "dark grey plates" or "brown socket" or "very bright label" etc.

Moreover, state that the Raytheon 6SN7s are well known to produce the warmest sound of all 6SN7s in the world.

Sell then in pairs, not in quartets.

So doing, you may end up to 50$ a pair if you are lucky.

Good luck

Tony I0JX

Reflected Power usually gets dissipated in the coax, but may result in unusual currents and voltages in the Plate output circuit and may not allow a proper load.

Whatever your Amp or proceedure, Pi-network outputs require maximum loading. It results in maximum output = maximum efficiency = minimum harmonics and distortion. Even a minor loading misajustment results in a big rise in harmonics and distortion. Your Club tuneup routine is an excellent proceedure since you would be providing sufficient drive at peaks and If a peak reading meter were handy, very meaningful. CW at the 80-100 watts would also be useful but there is little need to lean on it for more than a couple of seconds while looking at meters and tweeking a knob. Always keep an eye on grid currents as they are the most fragile they will be metered if it matters in your Amp (or protected somehow). Once tuned to maximum output in this fashion, you can reduce drive, confident that the final stage is fully loaded. Do this with a 50 ohm Dummy load so that you will know what this is supposed to look like as it is easier to do a little tweeking on the air versus tune-up from scratch into an impossible load.

Only because it takes 3 trips through the coax before it reaches the
antenna. Forward power only takes one.

I would ask the same question. Or, if you had 100 watts going forward from
the transmiter end of the coax on a 100 feet of 3 db loss/100 foot coax, then there is only
50 watts at the
end of the coax. If half of that gets reflected (i.e. 25 watts coming
back) from ant-coax mismatch, then it suffers another 3 db loss by the
time it gets back to the entry point on the coax (or, 12.5 watts +/-). At
the transmitter end, Roger and I are having substantial discussions by
private email.

2590. RCA Maritime HF Receiver question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-03 14:27:46 UTC
From: K3HVG <jeepp@adelphia.net>
Message-ID: <6fmdnYWq3o2OtDTZnZ2dnUVZ_vmdnZ2d@adelphia.com>
Source record: 11890

I have acquired an RCA HF receiver that, among other uses, was included with the radio installation on Liberty and Victory ships. The receiver in question is the RCA 8506A, 110AC/DC set. I worked on one of these that was installed in the RCA 4U equipment suite on the Liberty Ship John Brown, in Baltimore and, at the time, was fortunately able to copy all the books. However, unlike the 8506's in the 4U setup, this particular receiver came with a heavy-duty, shielded case and a front panel drilled for a typical Signal Corps (et al) nomenclature plate. The plate is smaller that the commercial RCA plate as seen on the 4U maritime equipment. I've been told that there is a Signal Corps designation for this receiver, R-xxx, and it may have been used on Corps of Engineers sea-going assets? If anyone any the info, I'd appreciate it. This receiver is a bit on the rare side, it would appear.

I have an HE-10 with an IF Gain control. The manual says to turn it
all the way for AM reception. Is this the same thing as an RF gain
control? The RF Gain on my Panasonic 2200 controls the sensitivity,
and so does the IF gain on the HE-10. So, what is the difference?

The manual says "all the way..." what?

The HE-10 is a Lafayette cheapie, or is it some comletely other
receiver? Because I have a vague idea that the receiver I'm thinking
of used regeneration in the IF amplifier to provide a locatl beat
oscillator for CW reception. And in that case, varying the IF gain
would affect whether or not the stage went into oscillation.

RF gain and IF gain will affect things somewhat differently, but
not in terms of overall gain. Some receivers may not even have an
RF stage. The point is to reduce the overall radio gain (as opposed
to audio gain) for various purposes, mostly to prevent overload. A
receiver that had both RF and IF gain controls, and I seem to recall
that some did, in terms of gain it wouldn't matter which one you played
with. But it might matter in crucial issues. If a local station was
overloading, reducing RF gain might reduce or eliminate front end overload,
because the signal wouldn't get amplified much before there was good
selectivity, while if you reduced IF gain for the same signal, it would
have no affect because it was the RF stage being overloaded.

The real time you'd see much mention of RF or IF gain controls was
in dealing with SSB, once it came along. For receivers that had no product
detector, you were told to reduce RF gain and then increase audio gain
(to compensate for the reduced RF gain, in effect overall gain would remain
the same or close to it while the distribution of that gain would change).
This was so the incoming signal was weak compared to the receiver's BFO
signal, because it needed to be much stronger than the incoming signal in
order to properly demodulate the SSB signal. In this case, it wouldn't have
mattered whether you had an RF or IF gain control, or which one you used
if you had both.

Michael

2593. Re: IF Gain vs. RF Gain

Source record: 11893

The He-10 was a pretty good receiver considering the price. It was conventional and did not use a regen if.

Perhaps the reason to use full if gain for am would be to allow the s-meter to read accurately and also allow the avc to work effectively.

The if gain and the rf gain do basically the same thing. If there are really strong signals, you would like to reduce the gain before the first rf stage to prevent overloading of the rf amp and mixer. However, a gain control in the rf amp can affect noise figure and signal handling. Perhaps the engineers working on it were not satisfied with the signal handling capacity when they changed the parameters of the rf amp with the rf gain control (I suspect that is the reson).

Performance would be equivalent to the Hallicrafters SX-99. It was a physical copy of the old S-38. Note that the tube line up shows that remote and semi-remote pentodes were used rather than sharp cutoff, so the radio was designed to perform as well as it could for the price.

Thanks for the reply, yes, this is the Lafayette HE-10, in mint
condition, recently recapped and aligned. The manual says to put the
IF gain control at maximum for AM reception, and to reduce it if it

overloads the receiver. The radio is very sensitive getting really
good DX here in South Florida.
I was just curious whether the IF gain was similar to the RF gain in
my other receivers. The radio also has a BFO pitch control for
CW/SSB, and a switch for AVC/MVC/BFO.

Someone else replied already and said it's not a cheapy, and your
description here does not make it sound like such. Of course, now I'm
hving a problem picturing which receiver it was.

Michael,
It looks like an S-38 on steroids! It has 9 tubes, the familiar half-moon dials, an "S" meter and it has a transformer, not the "hot tail" setup of the old S-38 (of which I have the C model, fully restored).

Almost a boatanchor! I picked this thing up at a yard sale over the
weekend for a couple of dollars. It works! Needs a good cleaning and
some TLC. There's a big discrepancy between signals of known freq on
all bands and their place on the dial...but all bands have signals.
Anyone know where to get an alignment chart for this toy ??

Source record: 11902

Hi All,
I am planning out the late summer / early fall and was wondering if the annual A.W.A . swap / meet in Rochester is worth going to anymore. I haven't been there in a few years and would like to know from those who attend regularly if it is worth the trip and expense. When I attended (and this was in the mid 90's), it was pretty lively with lots of vendors, moderate prices etc.... Should I plan on attending? I mainly look for boatanchors, but will pick up the odd table set and even consider consoles if the price is low enough.
rgds,
Mark S.

Well, I finally got around to testing the amp tonight...it doesn't work! < sob > I'm getting 0 plate and 0 grid current and the voltage is jumping straight to full scale (3000 volts instead of the 2400 volts specified in the manual). Any suggestions as to what could be the problem? In poking around, it looks like the zener diode on the rear of the amp might be missing. Could this be causing this behavior? Other parts of the amp appear to work....the meter responds to exciter power, the delay circuit works and the relay is operational. Any help would be appreciated.

2606. Repairing Yaesu FL-50B - HELP!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-07 06:41:03 UTC
From: Andrea Baldoni <abaldoni@nospam.invalid>
Message-ID: <hYqdnVoMJIVinDPZRVnyiQ@kpnqwest.it>
Source record: 11906

Hello!
I'm trying to repair a Sommerkamp(Yaesu) FL-50B. It does power up and transmit but the output power is just 13W. I tried to replace final 6JS6C without any adwantage, also replace the driver tube with same result.

The B+ is 350V, dropping to 325V while transmitting... Already tried to exchange the plate voltage filter condenser, but apart slightly minor ripple, no result in power output increase.

The transmitter is fully tuned, by me who may be not the best man for that, but hovever, I have a good oscilloscope and anyway, the power output before tuning was a (little little) less.

The antenna relay is ok. By measuring with oscilloscope the grid of the 6JS6C, I notice increasing in signal amplitude while rotating full scale "carrier" control from 0 to 8. After 8, signal no more increase and there is a little derive in 5.12.. Mhz carrier frequency. I think this is normal for this kind of transmitter. The strange fact instead is that despite driver signal is increasing, output power no further increase after carrier control position 4.

I have regulated bias to 60mA, I suppose it's good for 6JS6C, I have not the manual of the transmitter so I don't know exactly. Anyway, this has no strong influence over power output. While at full power, I never see IC more than 125mA, that's half the scale of the instrument. In PO measure, it signs slightly more than .2

Well, no more. Someone who has more experience than me, please give me his help!

...and also, I need to know what's (in Vpp) the right output of the carrier quartz oscillator measured at the input of the balanced modulator.
While tuning, I forgot to record the previous amplitude... Now, if I recall correctly, is 2.5Vpp... More than 3.5Vpp, the oscillator become unstable and may not start oscillating, less than 2.5, output power further decrease...
So I may be right, but I would like to know if there is an exact value to regulate on.

The power is more or less the same in every band, I use an FR-50B as VFO, but with a 9MHZ quartz I have, the results are unchanged. All measure are on a 50R dummy load with wattmeter. A Osker Block SWR/Wattmeter inserted hovewer sign the same output and no SWR.

Ciao,
AB

> the manual).

Without a schematic in front of me, and not enough clues and not enough background, I'll venture some guesses:

1. 3 KV should be impossible to get (IIRC, heath usually used voltage doublers in many of those amps from about 900 v on secondary, to get about 1.4x1800 minus bleeder and tube load, so the voltage should go down a couple hundred with plate current increase [similar to my present SB-200]). If there is a string of series resistors to make a "voltmeter" out of a current meter, possibly one of those resistors has shorted out (you would have to trace the schmatic and start measuring with a VOM).

Is the tube warming up? Turn the unit on, leave it on for some 10-20 minutes, then turn off (make sure that voltmeter says zero instead of anything above zero, let alone 3,000 volts) and touch the tube. Is it anywhere from warm to too warm to leave your finger on it? If its cold as the cabinet, then suspect blown filament (need a new tube, bad deal) or break in filament circuit (Be careful about interlock switches if they have one).

2. No plate current, no grid current? At all?

Any suggestions as to what could be the problem? In poking
> around, it looks like the zener diode on the rear of the amp might be

I can't remember from my SB-230 what the circuit looked like.

Could this be causing this behavior? Other parts of the amp
> appear to work....the meter responds to exciter power,

How? How are you determining this? Are you getting grid current with the application of exciter power? What meter response are you getting in which position of the meter switch?

How about do you have the remote activate line set up properly? That amplifier has its own internal TR relay and that needs to switch over from "amplifier bypass" when you are receiving to "amplifier-hooked-up" during transmit. There should be something like an RCA audio jack in the back that the manual should explain needs to be shorted to ground (center to ground, or something like that) to activate the TR relay. During transmit,

the RF from the exciter should be directed to the cathode input circuit of the amp and _then_ you should see lots of plate current and grid current (and output if you adjust the plate knob).

the delay circuit
> works and the relay is operational.

You mean it clicks when you go from transmit to receive or receive to transmit?

(see quoted material at end)

Craig, you might also want to think about finding someone local to you who is experienced and who can look over your shoulder (or vice versa) and who maybe can spot the problem more quickly from having all of your gear in front of his eyes. All of us out here can only see what you write down and not what you don't write down and that limits us to guesses and suggestions and more questions. I don't remember from the begining if whomever you bought the amp from said, or did not say, if he knew the amp was working fully up to snuf with no problems. You might review that with us, too. You could have a simple problem (I can't otherwise guess what is causing the 3 kv plate voltage reading on the meter) with getting the amplifier to work, or it could be tricky (and/or expensive, if the tube filament is open or anything else is wrong with the tube).

Finding a local person could take some work, too, but find a radio club if there is one close by, or look in the ham ads at the end of QST.

Hi:
I not have FT-50, but I have FT-200 with 6JS6 (x2) tubes in
amplifier outpout.- The plate voltage can be around 700 to 800 volt. , not
350.- It is a cause yoir problem off low power.- The idle plate current can
be 50 or 60 ma.
I suspect that to his problem this in power supply.-

Regards
Heriberto

Hi,

It sounds like your High Voltage is quite low.
A review of the FL-50 says the HV is 480 VDC key open,
dropping to 440 VDC at c.w. full power output.
Look for a bad rectifier diode in the HV supply.

Thankyou Heriberto and Edward, but I have the schematics and I confirm that the 350V are ok. It comes from a 120 0 120 transformer rectified in full bridge. 240*1.41 ~ 340V. The capacitor is rated 350V so it's the right voltage. The center tap of the transformer is used to have ~ 170V to ground for the plate of other tubes, by sharing two of the 4 diodes of the bridge for 340V.
I never see such configuration... curious method for saving components :)
Anyway, that voltage is also ok, measured only +160V, but with all tubes working.

Yes, 6JS6C could be used to 1000V, if I recall correctly, it's used such way in a old yaesu 1000W linear amplifier, in a quartet.
But theoretically, also with +350V (say, 200VRMS) and a 125mA measured current, the power should be at least 30W. In reality, despite the theory, the measured RMS voltage over the cap while transmitting is more like 100V than 200, so no power.

Ciao,
AB

Hello Andrea -
Here is the link to the review with the 480V voltage measurements
of the FL-50:
http://home.alphalink.com.au/~gfs/yaesu/Yeasu7.htm
Page one of the review says the rated voltage is 500V.
(500V at 100mA for 50w input). This would provide
a reasonable 250V buss for the low level stages.

D8 and D9 of the FL-50B are connected as for a voltage doubler.
If this were a standard full wave supply,
with half DC voltage taken from the transformer center tap,
they would not be present.

You might look at the label on multi-section capacitor C81 itself,
perhaps there is an error on the schematic which shows only 350V
for that first section.

: (500V at 100mA for 50w input). This would provide
: a reasonable 250V buss for the low level stages.

Thankyou for made me note this. I saw that page many times without never noting the voltage chart. Hovewer, it's for the 50 and not 50B, even if they have probably mostly the same circuit.

: D8 and D9 of the FL-50B are connected as for a voltage doubler.
: If this were a standard full wave supply,
: with half DC voltage taken from the transformer center tap,
: they would not be present.

In full wave rectifiers with center tap, we have only two diodes BUT the gnd is in the center tap. Well, you could use the center as GND and have a positive supply from the diodes, or also the opposite (inverted): put diodes on GND and have the center tap at positive. So, with a 120 0 120 transformer, we have a +120V (*1.41).
If we ignore the center tap, we need 4 diodes to have a full bridge and the transformer is like a 0 240, so +240V.
In that schematic, we have the two cases superimposed at the same time: the center tap is not connected to GND at all, instead is used to form another supply, the +160. It is a (inverted) full wave rectifier with center tap and two diodes, D8 and D9. The +350 is a 4 diode bridge, reusing D8 and D9 again but ignoring the center tap.

As I stated, I never see that way before, but do you agree with my analysis?

: You might look at the label on multi-section capacitor C81 itself,
: perhaps there is an error on the schematic which shows only 350V
: for that first section.

I'll look and report. Anyway, I suppose the problem is not there.

Hi, Andrea

Yes, you are right! Sorry about the confusion here.

It sounds like your rig should only make 10W at that low plate voltage.
It could be that they reduced the power of the original FL-50
to 10W in the FL-50B for use by the Japanese "fourth class amateur radio
operator", who did not need to pass a telegraphy examination.
This was easily done by reducing the plate voltage through a change
in power supply transformer.

: to 10W in the FL-50B for use by the Japanese "fourth class amateur radio
: operator", who did not need to pass a telegraphy examination.

I heard of the power reduced versions in the australian site (about the FL-10/40), but elsewere (rigpix database for instance) it's indicated as a 75W input. Now I'm sending mail to everyone I could find in Internet that seems to have a FL-50B. Who has used it, must know at least the power output! Hope someone will reply.

Anyway, if that's the case, it's a good and a bad news at the same time: I worked for almost a week in troubleshooting a perfectly working transmitter, I bought some spare tubes and a tube checker, etc... :(
But I discovered again the vacuum tube world so much in this week! :)
...that I decided to seek more old radio and I posted an announce for buying an Hallicrafters SX-88 and/or a SX-28!!!

And again, I got acquainted with this newsgroup :)

Ciao,
AB

In prep for a move South, I'm divesting of some of my operational collection. This equipment is currently on the air on a regular basis on the 75 meter MIL nets. It puts out about 120 watts, AM. The system will include the T-195B (both internal power supplies are solid-state), R-392, rack, dogbone, both front-panel blower baffle blocks as well as two exhaust hoses and attachment blocks. Also included will be the power cable, a mic and appropriate headset. Additionally, there will be a PP-4763A 28v 50A power supply. Books for the GRC-19 and PP-4763A will also be provided. This is very nice equipment, albeit very heavy! Pick-up in Frederick, MD (Suburban Wash DC), only. Being as I'll probably not have another of these sets, I'll throw in an overhauled spare power amplifier assy. I got from Fair Radio. Price for the whole lot is $750.

Hallicrafters SX-73 or R-274 HF receiver, also in very nice and fully operational condition. Tuning is very smooth. Receiver is mounted in an appropriate desk-top cabinet. All knobs are original and correct. Only "problem" is a missing dial-lock. Original Army TM (manual)is included. Price is $500. Again, pick-up in the Wash.DC area, only.

The above gear can be seen at www.qsl.net/k3hvg, although the SX-73 receiver is shown in a rack (at the time), not the cabinet. The gear is shown under military equipment. The site is best seen using Internet Exp.

New informations.
I had been able to receive a response from a FL-50B owner. He told me
he no more has any manual, but the output power should be 30/40W.
Hovewer, his transmitter, bought used from a CB, never output more than 15W,
also after realignment and changing final tube.
Wherever the problem is, it seems to be a common problem. I promised to
told him how to fix it, if I'll ever be able to fix mine... :)

How should be the output impedance of the 6JS6C? I'm beginning to suspect
it's not correctly loaded...

I am interested in recapping a Heath SB401 and a SB301 but I have several questions.
1 Do you try to desolder each old cap or do you simple cut out the old ones and add the new ones?
2. Where is a good place, web or otherwise to purchase new caps?
3. I been told that if the electrolytic are to old they will not polarize correctly. So how do you know?
Thanks for any and all replies.

> Thanks for any and all replies.

cap etc replacement - it depends on how "well" the original was put in there....if its been done "properly" then the wires will have been mechanically twisted round the terminals, with the solder providing the final "electrical connection only" finishing touch . This IS the correct method of doing it in manufacturing - provides protection against mechanical shock loosening leads, as solder has almost NIL mechanical strength.

If, like most exeprienced home brewers, the builder realised that the caps etc would eventually have to be replaced, then the leads would have been poked throught the tag and not twisted - in this case, removal is easy - just heat and pull on the lead.

Have a look - if its method one, then, from a service point of view, cut off the old leads and solder on top of them. Too much risk of damage to the support structure if you try to untwist/desolder a lead. The restoration purists will have hysterics on this, but as a service technician concerned with getting the job done with no additional damage, its what I would reccomend.

If it hasnt been fired up for a long time, a good service tip is to connect a 100w light bulb in series with the mains input to the radio - this will current limit it enough to prevent violent destruction and give the caps a chance to "reform' - but it is FAR better to just replace ALL the electrolytics anyway, chances are they will have dried out and lost value....

Most high value resistors (>100K) will have drifted UP in value - this is sometimes a subtle fault and can cause many weird symptoms, typically loss of sensitivity - radio just doesnt "feel" right....the beauty of valve equipment is you can pull the valves from their sockets to isolate them out of circuit to measure them...

Replacement caps - sorry, cant help you there as I am in VK. But it should be easy enough to find with Google.....

Andrew VK3BFA.

Thanks a bunch to the entire group for all the help and advice....as it turns out, there was a zener installed after all. Somewhere in the past the TO-3 cased zener had been replaced with a stud style that was pointed inside the cabinet. I did test that zener however and it was an open circuit both ways, so same as none I guess. Anyway, I contacted the guy I purchased the amp from and he (reluctantly) agreed to give me my money back. True, I could have replaced the zener with another one or with a series string of rectifier diodes (had even purchased some at Radio Shack just in case), but given the age of the amp and the expense of the tube, I thought it best to just return it and look for an amp that uses 811s or 572s. (Something cheap and available) Thanks agains for all the help...it was still a valuable learning experience.

I agree with the VK3. The conditions he relates are the ones you'll encounter. I'll add to the fray that when there are several leads going to, for example, a tube socket pin on an old set, its just too much to ask to clean everything out to make room for the new component. Oft times you'll create more problems then will be solved. Just be careful and be a bit artful when installing the new parts so they'll look good and work properly. If there is only one lead to worry about, it may well be appropriate to wick the joint and un-clench the old lead. That will be a judgment call on your part. As far as where to buy, I can recommend Mouser. They have the gamut in capacitors, et al, both the smaller types as well as the larger "orange drop" types. It does appear, however, that the selection of axial electrolytic caps (1-40ufd range)at 450v (typically) is getting smaller. I've laid in a stock of these, of late. I'm sure some of the restoration purists may have their word in this and that's absolutely appropriate. I re-build gear to get it (back) on the air, reliably. I don't chose to re-create the Hallicrafters production line.

Well, you are lucky the guy took the rig back and refunded your money.
Usually that doesn't happen (but I'd be interested if anyone else has any
experience trying to return used hamfest gear for some kind of refund).

Unless you are filthy rich, its a good idea to look for low cost
amplifiers with relatively cheap tubes. I'd stay with large glass tubes
(you can see filaments light up, see if there is glow of plates,
internal darkening from evaporated tungsten, "blown" getters (white
instead of silvery), etc.), stick with triodes and grounded-grid for
stability and simplicity, and cheaper. TV sweep tubes...stay away from
them. Out of several sweep tube amps I bought used, all had soft tubes and
replacing a set of those is often not cheaper than, say, four 811s.

I've had several SB-200s (pair of 572s in GG) and they all worked quite
well. I would also advise to look for any amp that has a built-in SWR and
output meter (because I would prefer to tune the amp for output and then
go back and make sure the other metered currents and voltages were close
to what the specs say, then get on-the-air reports).

Good luck.

FYI, FWIW....

This might sound like I am throwing you a "curve ball" but I'd like to ask if you are doing this because: i) "its cool" or ii) because neither unit is working and you are sure the problem is an open or shorted or leaky cap and you are sure that replacing all of them will bring both units back to life?

There is a philosophy, which is good, that doing a recap job will surely make it unnecessary for the next 50 years to recap anything again....

Then there is a philosophy, which is also good, that "don't fix anything that ain't broken". And, if something is broken, then fix just that (I've had a lot of dentists urge me to "fix" something that was not broken but they said could break any day, and I've had those somethings for 30 years)

Then there is a philosophy involving preventive maintenance (this is real good for flashlights with replaceable batteries, oil changes for cars, blood tests in the doctor's office, etc, etc.).

I usually go by the second philosophy, but not because I can prove its better. Its just "my" strategy and approach to life.

Just FYI, FWIW.

>73, Cecil http://www.qsl.net/w5dxp

Yup, points to Cecil for realizing this.

Based on similar turns of phrase in a private E-mail message sent to me recently (of the usual, unhinged, "I didn't ask to be welcomed to this newsgroup!" variety), I can say with great likelihood that the perpetrator of this forgery is the individual who posts on rec.radio.amateur.policy with the E-mail address "wussyroger@yahoo.com." I sent a complaint to alt.net and altopia.com in case they caught the poster in their logs.

It seems that we've really, really hit a raw nerve here among the unbalanced trolls who populate rec.radio.amateur.policy. They very much seem to fear the prospect that a new, moderated discussion newsgroup for amateur radio stands a good chance of getting created, one that will leave them behind.

I suspect that there will continue to be a storm of retaliatory forgeries for some time to come, at least through the fall. As I said previously, check the headers. If something appears to be from me, and is not from Novia/Newscene, then it's a forgery. Check also for misspellings, poor grammar, and obscene language.

2639. Need Schematic and Info on RCA A-203A/SR Receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-09 20:56:27 UTC
From: Dave <n7rk@nospam_cox.net>
Message-ID: <04esg.26147$8q.11208@dukeread08>
Source record: 11939
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

I picked up an RCA A-203A/SR Receiver and a pretty awful (the price was right) looking but appears to be complete AR-77 at the Williams Arizona hamfest on Friday.

No problem finding info on the AR-77 but have found nothing on the RCA A-203A/SR Receiver other than a mention in the Osterman book. This one is complete except missing the dial cover and dial scale. From the picture in the book looks to be a fragile plastic easily broken and easily lost dial. The pointer is still there. The radio appears complete in all other aspects however it has been painted silver. Why did people do these things? When I got my Breting 12, it had been painted blue.

Anyway, I am looking for a schematic or manual or any other documentation on the RCA A-203A/SR Receiver. Does anybody have one that has the original dial that they might be able to take a photo of and e-mail me. Also, what was the original color before it was "silver plated?"

Also looking for any comments, positive or negative on this receiver.

Tnx and 73,

Dave N7RK

Oh, it's a forgery alright, unless he doesn't know how to spell his own name. He spelled it correctly once, mispelled it twice, and none of the domains resolve. And the sender was not using his ISP, which is easy to find.

A little attention to details, checking of headers, plus google goes a long way folks.

They're not getting their money's worth if that's the best you can do
with headers. The post by "Mike" came from supernews.com, and that's
not where the forgery originated.

Maybe you can get a job at Burger King.

Your unsolicited email to new news group users seems to be in danger
of violating novia.net's terms of service. To quote from
http://www.novia.net/acceptable/

--(begin quote)--

2. Sending any unsolicited electronic mail message:

(i) to 25 or more electronic mail users, or

(ii) to multiple electronic mail users in a manner which generates
one or more complaints from such users.

--(end quote)--

It's (ii) above which piques my interest. If it only takes ONE
complaint from a mail recipient, aren't you in effect living in a
glass house?

If you're going to contact others' ISPs, perhaps you'd better take
care that they don't become angry enough to contact your own ISP, at
least until you clear up that possible problem with item 2(ii).

You know what they say about people who live in glass houses.

So you've been receiving complaints since 1999, yet have kept on
sending unsolicited email (UE) anyway.

What a stellar track record.

Your "logic" for continuing your UE ("My ISP lets me do it.") is very
similar to Mark Morgan's logic for continuing his ongoing flood of
rrap. Will you stop the UE once you have created your own moderated
group in which to play?

Somehow I doubt it.

Not too good either. A lot of high-end retail has dealer margins
significantly higher with much less risk (although a higher cost of
doing business) than buying "high" on E-bay and selling "higher" on
E-bay.

Some rather business-savvy folks advocate that the optimal E-bay
sell:buy margin is 30:1, with good arguments. Anything else is just a
hobby.

Tim.

I've been the last couple of years, enjoyed it and plan to go this
year. It's only and hour and half drive for me. It's not *just* about
the flea market which can get decimated by bad WX as it did a couple of
years back. Some of the talks and inside exhibits are really worth the
trip for me.

So to sell, say, an NRD-545 for $1500, I would have to buy it for $50 ??
Good luck with those margins!

Calling all trucker/hams:

The Vintage Flying Museum needs your help!

A generous ham has agreed to donate a complete BC-375-E radio transmitter setup to the Museum, which we plan to install in our B-17G Flying Fortress, 44-8543A, N3701G, "Chuckie". Unfortunately, the equipment is located in Mansfield, Massachusetts, and the Museum is located in Fort Worth, Texas! We are looking for someone in the transportation business who would be willing to donate their services and transport the equipment for us. The load would be on one standard shipping pallet, stacked about 4' high, with a weight of probably 200 pounds or so. The donor is under a deadline to move the radios out because his job is transferring him overseas later this summer. We are a 501(c)(3) tax-exempt organization, so we can provide a tax receipt for the value of your donated services.

If you can help, or you know of someone who can, please contact me directly via email > > > k5dh@qsl.net

Thanks and 73,

Dean Hemphill, K5DH
Volunteer B-17 Crew Member
Vintage Flying Museum

> Good luck with those margins!

Overall, doing the "buy as highest bidder on E-bay and then hope to resell for more money on E-bay with no real value added" and making money at it is not the easiest way to make money.

While Marty's attempts at it are often cited in this and other newsgroups, it is not at all obvious that he's making any money at it overall. Sure, everyone likes to point out his, er, um, successes and get inflamed about them, but please try to think how you could make money overall (ethically and honestly) doing the same thing.

Now as a hobby, if you had a lot of spare time and storage space and some spare cash it might be fun to be a radio trader. You'd have a lot of different stuff passing through your hands and you might enjoy tweaking/painting/cleaning as they go through, and you might actually enjoy writing exaggerated claims for each and everything in your inventory.

For most of us (at least folks like me, who lack the, um, creative marketing skills that Marty applies) it'd probably be economically wiser to push carts at Wal-Mart part time if the goal was to make money and not stretch the bounds of ethics/honesty.

Tim.

Over the weekend I was lucky to find a near mint R-392.
Works great! I'm trying to decide if its worth looking
for the companion T-195 transmitter to use on the air
(AM &CW). Fair Radio has these for not too many $$$'s.

If anyone out there is using this combination on the air,
I'd like to hear your comments. Thanks!

Steve

With all due respect, that was a load of BS. I sell honestly on Ebay and never had a unsatisfied customer and I've made lots of money doing it. If I had the time and didn't already have a great job, I could make a great living using Ebay as a sales platform. Make more $s pushing carts at Wal-Mart part time? Maybe if your an idiot.

Bob, Somebody gave you a bad steer. Real Ameco AC-1's have been going on eBay for $280-350. They are collectors items. If somebody told you it was only worth $100, and then offered to buy it, they are ripping you, unless your unit is a wreck, or highly modified.

Source record: 11827

Steve, I'm currently running a "B" model, here. My particular unit runs about 120 watts output on AM, and a touch more on CW. Both my GRC-19's came from a surplus dealer in Scranton, PA. I was able to get spare/replacement HV/LV power supplies from Baran's Surplus, also in PA. They also have racks. I do know that they told me last year that they have not located more of the HV supplies. A straight T-195, with both dynamotors requires about 44 amps running current. That's not too bad but its the starting/inrush current that's a bear! I measured my original T-195 at 97 amps inrush. Power supplies like the PP-4763 just won't hold the load. Using parallel batteries does not help this particular supply, either. The best thing to do is find one with (at least) the HV power supply solid-state module. The LV dynamotor isn't too bad. The servo system in these transmitters require a solid 28.5-29 volts to make them run properly. Less voltage and they simply won't tune-up. Changing the discriminator diodes can help, a lot. In fact, the TM calls for regular change-out of these matched diodes. Relays and connectors can be problematic in units that have been sitting around for a while, and not in use. If you get a T-195 and find you need a replacement special discriminator chopper, I have a good stock of them. Blowers are critical to proper operation and can be a source of failure. Early T-195's use a straight 28v blower; later A's and B's use an a.c. blower and an inverter card to drive them. FYI, both can be retrofitted with a blower removed from an junked ARC-27 UHF transceiver. The final and modulator tubes, the 28v 4X150D, are still available but require a bit of looking, at times. Fair Radio did have overhauled PA modules with the tube. Use of a headset is all but mandatory given the high-level blower noise... its impressive!! Front panel meters can be a problem, too. Many transmitters had the meters removed prior to surplus action. The multi-meter can be replaced with any of the military miniature 1ma movements. The modulation meter is, in reality an a.c. VU meter. I've used a 100ua or 1ma movement driven by a diode bridge circuit and voltage divider (pot). One can calibrate the meter and it works just fine. Another tip is to drill out holes in the side of the transmitter outer cover so access can readily be made for modulation and sidetone levels. Its a pain to undo a million hex nuts avery time you need to make a simple adjustment. Oh yeah.... there's a safety interlock on the rear of the transmitter. If you need to run the tx out of the case, its necessary to pull it out (on) to activate the tx. Be sure and get the correct book for whichever variant you end up with. There are sufficient differences that require it. Also, the TMs have an error regarding the primary power relay wiring. I fought that one for a few days before discovering the error. The tx uses 4AG type fuses which are unobtainium, at least for me. You can, however, carefully reform the fuse clips so that 3AG types can be used. Lets see... what else.

Oh.. try and find the blower outlet hose adaptors to use instead of the deflector blocks. Its a lot quieter and you don't have hot air blowing on your face. Fair Radio has the connectors to make up a dogbone if you don't already have one. Well, that's about all I can think of, off the top. I like my set-up here and get on with the East-Coast MIL net with regularity. Let me know if you have any questions I may be able to help with. I don't know it all but I have been down the road with this equipment. Jeep/K3HVG

Source record: 11832

I have junker TS-520s I been trying to get to transmit, no output not even a hint, there is no high voltage anywhere in the final section, tubes light up and get hot but no high voltage and placing a receiver next to the rig on transmit there is a slight hint of a carrier but very faint and right on frequency. The tubes check good and have tried different ones with no sucsess.

Any thoughts on what to look for?

Gil

This whole thing was started by what's called a troll. It was forged, not from the person it purports to be from. Many of the "responses" are also forged, and from the same person or his cohorts.

It exists to piss people off, get them riled up, and so the forgers can sit back and laugh at what they have gotten those in the newsgroups, who they consider to be idiots, to post as responses.

Tom
K0TAR

A ham who came from CB a long time ago, ain't a know-it-all, and doesn't care to tell you what to do, since it's your business.

2690. Low cost SMD Oven for making SMD samples and Prototypes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-12 10:59:08 UTC
From: erica <erica@auto-system.com>
Message-ID: <1152701947.967645.269910@h48g2000cwc.googlegroups.com>
Source record: 11840

This SMD Oven Controller (SMDOC-01) is designed to use with a toaster oven. It provide a low cost solution for making SMD prototypes and samples. The temperature profile is similar to the expensive industrial SMD oven provided. So, the sample quality is as good as the industrial oven can do. It is capable for packages including 0402, BGA, QFP, SOP, SSOP, TSSOP, SOT, etc. It is an indispensable tool for R&D and making samples. It is very suitable for electronic companies, laboratories, universities and hobbyists. SMD Oven Controller (SMDOC-01) is only US$206, including oven (PCB size is large up to 19 x 17cm) is US$283. Voltage 220V, 8A fused.

Features:
1.Small, low price, performance comparable to expensive industrial SMD oven.
2.Capable for any SMD packages. An indispensable tool for R&D, sample making and small batch production.
3.No hand soldering. No painful. No difficult. Save time.
4.Connectable to PC via RS232 for profile setup and temperature monitor. It can also operate independently without PC.
5.Simple to use. LEDs indication for each stage of pre-heat, soak, reflow and cooling. Alarm and power cut off after finished.

Product information : http://www.auto-system.com
Please send me email : erica@auto-system.com for any inquiry or order.

2691. Re: Latest RADIOMART ebay scam!!!

I agree with all negative comments regarding RadioMart, but I think most people in the hobby already know about him and have him filtered out of their eBay searches. He caters to the newbies.

However, I disagree that eBay is a bad place to buy gear. It is definitely the largest collection of radio and related equipment available, and with careful buying it is possible to avoid being taken. I have had a few attempts to rip me off, but Paypal is your best friend when it comes to getting your money back. EBay knows it can't afford to alienate buyers with a bad reputation and so it protects sellers pretty well. And the nice thing about eBay is that if a particular seller seems shady or uncooperative, just walk away. Another one just like it will always come up.

Start at the power transformer and work your way forward. Is there
any AC across the HV winding? Is there DC at the output of the rectifier?

If the HV rectifier is open, check the caps out very carefully before
putting a new one in.

There is no absolute way to avoid being taken short of trying to buy
elsewhere.

> I have had a few
> attempts to rip me off, but Paypal is your best friend when it comes to
> getting your money back.

Ebay owns Paypal. They watch each other's backs.

> EBay knows it can't afford to alienate buyers with
> a bad reputation and so it protects sellers pretty well. And the nice thing

After a sale, when the purchased item arrives and the buyer can see it was
misrepresented, Ebay always supports the seller; that's where their money
comes from.

Although eBay is convenient, the company employs dummys, and is impossible
to deal with when there is a problem.

I, like many hams, have gotten a lot of surplus stuff from Fair Radio Sales in Ohio.

Monday, I discovered Surplus Sales of Nebraska.

Nice people! Old school customer service. The web ordering isn't "modern". But they don't make a lot of money at this, I'm sure. So I.T. people are probably out of the question. But your order gets underway in about 48 hours.....

They told me the owner spends all day on the net trying to hunt down surplus stuff he can buy. So if you have anything, I was told to take a photo of it....and send an e-mail to him. His e-mail address is at the bottom of every web page.

Here's the website for Surplus Sales:

EBay/Paypal do not always support the seller. Although I've had relatively few problems, by asking good questions of the seller and being willing to walk away when things don't seem kosher, in the 4 or 5 times that I've had to file a dispute because something was misrepresented, Paypal has sided with me (the buyer) and I've always gotten my money back. It sometimes takes a little longer than I would like, but if you're a reasonable buyer and can provide the facts about why an item was misrepresented, you won't have a problem getting things resolved.

Also, eBay/Paypal don't "side" more with either buyers or sellers. They side with the party that is right, in their judgement, after looking at the facts. They know that they can't afford to alienate buyers with a reputation as a place where you are easily ripped off. Confidence in the buying experience is what made eBay what it is today, and they are not stupid enough to give that up.

So if you have had bad experiences, perhaps it is because you have filed complaints that were not reasonable, or maybe you didn't ask all the right questions before you made a purchase. Possible?

No offense, but only an idiot wouldn't have known that they would "spin
up" people on these news groups, or any others for that matter. Your
idea is possible, but I'd have to say not probable.

If what you say _is_ true, maybe he'll 'fess up. That would be interesting.

I'm going through a dispute now where a guy who was finally kicked off ebay
(phil9923)
It took me over a month to get a refund from him for a radio he never
delivered. Now, another month later, Paypal sends me an email stating that
he may have used a stolen credit cars to pay me my refund and they want ME
to give it back. EXCUSE ME! That is and always was MY money. In the
meantime, my Paypal account is frozen. Thanks, Mr. Love, like that's your
real name...

Yup...good ole surplus sales....you can buy better but you can't pay
more....rediculous prices...

That was my take as well, although I saw things there that would be unobtainable from other sources. For those--IF you need them--any price is reasonable. For the rest...yeah, the prices seemed too high. The OP states they're not making much margin. In that case, there's something wrong with the business model that they're trying to make up off the customer.

None of your assumptions are correct.

The device was a "New" Video Grabber, complete with the power supply. It was one of 25 identical units being auctioned.

The unit arrived with a Radio Shack universal 300 mA wallwart (obviously NOT part of the "new" unit). The Video unit requires 3 Amps, as imprinted on the equipment.

The eBay resolution was that the seller would return what I bid for the unit, but I must pay to ship it back to the seller. That is NOT a reasonable resolution. The seller should, at least, have paid the return freight.

I also told them that, alternatively, the seller could simply ship me a correct power supply, which he did not want to do.

A correct resolution is that I should not be out anything for this misrepresented deal. The seller should have paid me for my original shipping cost and for reshipping it back. Anything less, permits sellers to pull shady deals and get away with it, at eBay's profit.

By the way.... Top Posting is the mark of, at least, a non-observant newsgroup newby.

Don

Yes, that's one of the downsides - you will generally be responsible for getting the item back to the seller at your own expense. However, I've always gotten my full payment refunded, including the original shipping costs TO me. Paying shipping for the return trip is simply the cost of doing business and part of the risk you assume. Just like in the physical world, if you buy something from the store that doesn't work and you want a refund, it's up to you to get in your car and drive to the store at your own expense. They don't come and pick it up, or pay for your gas as part of the refund.

I understand that some people have had bad experiences on eBay. My point is that I have bought a lot of radios through eBay (including one just last night) and have had few problems. EBay is the ONLY marketplace where such a large number and variety of radio-related equipment is available, but you have to follow a few simple rules.

1) Ask a lot of questions and be willing to walk away if the seller is unresponsive, vague, or seems shady in any way. There is never an item that you MUST have; another one just like it will come along.
2) Save all email correspondence between you and the seller regarding the item and it's condition.
3) Pay attention to the seller's feedback.
4) Use only Paypal, with a credit card, to pay for your purchases.
5) Be reasonable in your expectations.
6) If a problem does occur, present your dispute in a professional and reasonable way.

That brings to mind a question: Is there any way to stop paypal from insisting on using your linked bank account as its first choice?

The reason I ask, is I accidentally forgot to check "more payment options", and didn't notice until after paypal finalized the transaction. Paypal attempted to overdraw my account, and I got charged a $25 overdraft fee by my bank. The idiots at paypal were going to retry this 2 more times before quitting, and using my "backup" credit card. If I hadn't noticed, this transaction would have cost me $75 in overdraft fees. There was no way I could cancel the payment, and switch to a credit card.

I complained to paypal, because I thought they were supposed to check the balance on the account before they tried to draw funds, but they ignored me completely.

Don't give them an account number in the first place.

A few years ago I listened to a radio show called 'The Troubleshooter'
done by a guy named Tom Martino, and he's still going today. One thing
he always harped on, hard, was 'Never give anyone access to your bank
account beyond the checks you write.' Not health clubs, insurance
companies, utilities, car payments, rent, paypals, not anyone. My first
wife allowed the insurance company to automatically deduct our /monthly/
premium from our checking account and two days after she'd set that up
they took six months' worth and we were bouncing checks. We had to
close that account and I don't do business with that insurance company
any more. I'm also no longer married to her but that wasn't
precipitated by the bank fiasco.

Hardly a month goes by without hearing about something similar. It
might be difficult to not give Paypal your account info, especially if
you sell on eBay, but I'll never do it. I've considered setting up a
special account just for Paypal and keeping the balance very low but the
monthly low balance service charges and that I'll get dinged just like
Chuck for overdrafts just doesn't make it worth it.

Until banks are more responsive to consumers and allow limits on such transactions (and I'm not holding my breath ;-) I don't engage in such transactions.

Tom Martino is still at it,

I agree that trimming is sometimes a good idea.

But as you have done, one can trim too much such that the "real" thread is
lost. All you left was the afterthought.

Also, too often, particularly on s.e.d., I see people trimming to enhance
their position. It's a judgment call whether and what, to trim.

Still, buying, say, a Collins KWM-2 on Ebay, and reselling it on Ebay
for very much more, that has to be a marginal venture, monetarily.

I'd imagine the best bet would be to hit the widows & chilluns getting
rid of a Silent Key's equipment, but I wouldn't have the stomach for
that...

Not practical, paypal cuts you off after you have made an accumulated
$2000 in payments. The only way they will let you exceed that limit is
if you tie a bank account to your paypal account.

Further, ebay encourages sellers not to sell to unconfirmed addresses.
The only way to confirm an address is to link a credit card, or confirmed
paypal account to your ebay account.

I agree with him. That is why I opened this account just for paypal. I
only keep $50 in the account, hence the problem.

Not health clubs, insurance

That is exactly what I did. Credit unions charge no service fees, and have a $50 minimum for startup.

He trimmed exactly the right amount. He was only commenting on your comment about top posting.

Personally, I have found it better to allow others to do things the way they want to. They are going to anyway. So, I tend to avoid making comments about others grammar, spelling, and top/bottom/or sideways posting habits.

If the post offends me, I tend to ignore it.

Banks often cash altered checks. Further, you are giving out your bank
account number, which in turn can lead to other forms of hacking.

I use a credit card that is just for internet use with a bank account
not connected to my main back.

Also, pay for small items with cash, especially in restaurants. The
less exposure of your credit card, the better.

It comes down to weighing practicality versus prudence. I've closed old
and opened new paypal accounts when I get too close to the limit, even
on the same credit card, and that limit was $10k the last time I opened
a new one.

> Further, ebay encourages sellers not to sell to unconfirmed addresses.
> The only way to confirm an address is to link a credit card, or confirmed
> paypal account to your ebay account.

I've never had a seller bring up the 'verified' issue even when they say
they'll only ship to a verified address, maybe because I contact the
'must be verified' sellers personally in addition to the automatic
post-auction contact. Like paypal, they're mostly interested in the
money and will bend their rules a bit if it looks legit.

> ...I opened this account just for paypal. I
> only keep $50 in the account, hence the problem.

I'm sorry it hasn't worked out better for you and I hope it gets better,
but my experience makes me cynical and it's not that much more trouble
doing what I do now. The again, I don't sell often and I don't take
paypal payments when I do. That may have to change, and I'll have to do
the special account business, and watch it like a hawk on bunnies.

> That is exactly what I did. Credit unions charge no service fees, and
> have a $50 minimum for startup.

No local credit union available for me.

73 and the best of luck to you,

How? When I tried that, they told me the card belonged to a previous
account, and would not let me open a new one. [That was the first thing I
tried when I got close to $2k.]

My experience exactly. I was perfectly happy just using a CC with paypal,
but then I ran out of dough, and had to link a bank account.

And I am happy with that arrangement, but I only want to use a CC for my
payments, and they insist on making my linked account be my primary source,
with the CC my secondary... the cause of my overdraft problem.

I've made the same mistake once or twice myself, Chuck. It doesn't matter a whole lot to me, since I pay off the credit card in full anyway, but I do like to have that last bit of protection in case something goes really wrong (which hasn't happened yet, but still....) and I also like to have the one-month float.

I don't think there is a way to make the credit card the default payment option; it's one of those annoyances in an otherwise good service. It's curious why they didn't try the backup credit card right away. That's good to know.

That, of course puzzles me too. I have had it make the right choice on other occasions when the amount was several times the amount in this account. This time, the account was about $7 short of the needed amount. It is an otherwise static account, so its balance shouldn't ever drop on its own... they screwed up, and I got to pay.

Please educate me. I see one of these for sale on ebay that plugs into a crystal socket. I know that a lot of boatanchor IF's are 455Kc, does this generate the IF for old receivers, or is it a bandpass filter?

2729. TBS-7 RF Ammeter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-14 10:39:30 UTC
From: Joe McElvenney <ximac@btinternet.com>
Message-ID: <afseb295o5krdeq5r0so125ls899kavcri@4ax.com>
Source record: 11729

Hi,

Recently I picked up a NOS GE RF ammeter for a Navy TBS-7 with the scale calibrated as 0-4A at 70 x 10^6 cycles (their words). Although I cannot find a manual for it I understand that the transmitter on this rig put out some 50W from 60 - 80MHz into a 70 ohm feeder.

Now if the load were a purely resistive 70 ohms at 70MHz only about 0.85A would be indicated making the 4A range seem a bit of overkill. Although I realise that at some frequencies the opposite would be the case, 4A does seem a lot. As a result I'm curious about the way the TBS-7 was matched to the line and wonder if anyone can point me to a schematic?

Cheers - Joe, G3LLV

Ed, I think you'll find that its a bandpass filter centered on 455kHz.
The part about a "crystal socket" is a mystery..... You also need
to know what the loss and bandwidth is before considering it. Also,
does your particular application make accommodation for a filter (loss
compensation, et al). If not, you'll need to do some design work,
albeit simple.

Actually, I don't think it can be defined from the poster's description.
It could merely be a crystal, after all many an old receiver did use a
single crystal in a filter at that IF, and that would explain the "crystal
socket".

Either the Ebay description is suspect, if it can't explain things then
maybe the seller doesn't know what he's got, or it's been garbled when
posted here.

I looked it up..... It is clearly just a crystal at 455 kHz. There are
three available. It could be used in a notch filter, a bfo, or to make a
simple 455kHz oscillator for boatanchor alignment.

Don

There's an interesting-looking Hallicrafters 455kc crystal filter
on eBay, I assume that's what Ed is referring to.
The crystal holder has a neat lead seal with a Hallicrafters "h"
impressed on it, to keep anyone from opening the holder.

That type of filter is a prewar design (one-crystal filter),
where the crystal was part of a balanced circuit
before the first I.F. amplifier. It could be used
with a variable "phasing" capacitor
to null a heterodyne, or sharpen reception bandwidth.
Most receivers used a switch-selected set of resistors
across the single crystal filter
to reduce the selectivity to permit 'phone reception.
(for example: the Collins 75A-2 receiver)

Better than nothing on a crowded c.w. band, but the ringing
is annoying and tiring. Modern crystal filters
are the lattice circuit type, where an array of crystals are used
to get a flat-topped passband of the desired bandwidth.
A "six pole crystal filter" has six individual crystals in the filter.

73,
Ed Knobloch

2736. FA: Collins AN/PRC-47 HF Xcvr. Ending Today

Exactly. I have several pieces of ham equipment that I bought on eBay
and I got what I paid for every time. The only real problems have been a
couple of people who mistook a customs invoice for a declaration of
replacement value for transport loss. In one case the difference was
large enough to need correction.

But I have, looking around here, a keyer, paddle, microphone, HF rig,
antenna tuner, audio DSP filter, artificial ground, Noise canceller,
speech processor, flashlight and reading light--all acquired via eBay.
And that's just my desktop. Around the room, a portable air conditioner,
another HF rig, digital TV receiver, HDTV VCR, DVD player, stereo, HDTV
set, and VHF-UHF handheld. In my bedroom there is an old S38B
Hallicrafters. All from eBay.

The trick, you see, is to evaluate the listing (and the lister's
feedback) to ensure that the item is what you want. Then don't bid
anything more than you're actually willing to pay for the item. Take
shipping into account. This means you will lose a lot of auctions. But
you should not care, since you will lose them to people willing to pay
more than YOU think the item is worth.

Now, a fair amount of that stuff was new when I bought it and came from
dealers who happen to operate eBay stores. But a lot of it was second-
hand as well.

I only ever had one problem that involved real money. And It was my
fault, not theirs (I got suckered into dealing outside eBay channels).

Just a week ago I had a minor problem where something stuttered and I
bought the same thing twice (from a dealer). eBay told us how to handle
that smoothly and promptly so that I didn't have to buy twice and the

seller wasn't charged for the sale.

The thing with eBay is to document every sale ON eBay. Do everything through eBay, except possibly private emails to a seller or buyer (but keep copies). If a dispute arises, it is usually because either the seller has misrepresented an item or the buyer doesn't want to pay for it. And eBay is well aware that, without buyers, they'd be a shell, not a business.

www.radiodaze.com. It's geared largely to antique radios, but the catalog is loaded with stuff of interest to ham tinkerers, too--power transformers, PS chokes, different types of caps, including lots of HV electrolytics, chassis (never have figured out the plural of chassis, if there is one), much more. Browsing the catalog (hard copy!) is fun plus.

Is it possible (just a little bit possible) that a scamming seller would lie
and
tell you what he thinks you want to hear rather than telling you that he is
selling
a piece of junk. Possible ?

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/247756

Topics discussed in SolderSmoke #27:

-- Computer woes
-- Bill's visit to the Dominican Republic
-- Building Xtal oscillator with kid
-- Book Reviews:
"The Art of Electronics"
"The Electronics of Radio"
-- Ether and Quantum Mechanincs, Tao of Physics
-- SolderSmoke Mailbag: Nigel in Dover, Mike WA6AWA, Matt KC8COM

CHECK OUT A PICTURE OF SOLDERSMOKE'S LONDON STUDIO:
http://usgadgeteer.blogspot.com/

Listen at: http://www.ourmedia.org/node/247756
Background:
Tired of listening to Led Zepplin or NPR on your
I-Pod? Wouldn't you like to be able to carry with
you the kinds of ham radio conversations that you
listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in
London, England meet regularly on the ECHOLINK system
to discuss their homebrew radio projects. We are
making them available as PODCASTS.

NEW RSS FEED: You can subscribe to the program, have
them downloaded to your MP-3 player, and listen to
them at your convenience. To subscribe, just cut and
paste this URL into your I-poder (or similar)
software. We've been having trouble with our Ourmedia
RSS feed, so Mike (software wizard that he is) has
homebrewed his own RSS feed. In order to subscribe to
SolderSmoke, point your podcast software to:

http://kl7r.ham-radio.ch/soldersmoke.rss

If you don't have an MP3 player you can just go to the
site below and listen to the latest program (and
earlier editions) using the audio software on your

computer.

http://www.ourmedia.org/node/247756

Here's the homepage for our show. All our programs are available here. There is also a blog and links to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

73 from London
Bill M0HBR N2CQR CU2JL

The $280 - $300 is a fair price - IF the unit was in very good to excellent condition - worked and was not modified. Modifications - such as adding an SO-239 - dramatically lower the price.

Yahoo Groups has an active Ameco AC-1 .. with photos of originals - PLUS KITS for building the "new" clones - with all parts. Join the group and get educated.

Larry -

I have met and know Bob (owner of SSN). He use to work at Collins in 1970s - and moved back to Omaha. He picked up large amount of Collins surplus - in late 1970s and early 1980s - and had a few "local" Cedar rapids hams buy items for him -- before Rockwell closed the "Surplus Store" in mid-1980s.

I have sold him surplus Collins items that I have picked up from the Collins store in early 1980s.

He traveled the Midwest hamfest circuit for over a decade - before he discovered "mail order and catalogs". As the Collins inventory has dwindled -- Bob has migrated into "general surplus" - largely electrical. Surplus can be a tough business of buying excess inventory or large quantity of items - and then finding the right market (It's not a "get rich quick" business - and you need cheap STORAGE)

Most of the comments I have read are factually based.

The Web site can be deceiving - and has not changed for a few years.
1. Products listed and shown that are no longer available (and have not been for at least 2 or 3 years) - such as Turner hand microphones.

2. Current web photo of the warehouse is bogus (It does not look like that)
-- SSN shipping address changed about 2 years ago - none of the photos changed.
I have physically been to that address - no signage and in a 2 block area north of Qwest Center (location of Union Pacific's old "shop yards") north of I-480
2 local businesses in other warehouses - did not know of SSN as a company in the warehouse area.

Draw your own conclusions - my opinion is private and based upon 25 years of fact and personal selling/buying experience with SSN.

USENET is not here for advertising purposes - which Bill's post comes very close to.

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 16th 2006
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Hello,

Please check ebay auction for National SW-3 (SW3, SW 3) 3-tube TRF,
radio receiver VGC, works! The radio uses one tube for RF stage, second
tube is regenerative detector, and the third one is audio stage. No
reserve.
Item number: 290008523376.

Tnx,
Vlad, kb9olm

And tell us all how you think this qualifies as a boatanchor?

It's not tube based, it's not heavy, and it's not old.

This is what happens when people think ads belong here, others decide
then that their ads are just as important.

I picked up a RMA69 receiver a few years ago. Looks to be in very good overall condition, but will need some power supply work before I dare to plug it in. Anyone have suggestions where to find information on the receiver? I haven't had any luck with online searches. It seems as if this thing was abandoned and forgotten about decades ago.

Any suggestions please email me,
warrens at ns.sympatico.ca

In my opinion I think you should avoid carbon comp's altogether. Try
Circuit Specialists or Antique Radio Supply both in Arizona for really
great carbon film substitutes. 73's Mike K8MB

Digikey happens to stock some 1W Ohmite carbon composition resistors.
They aren't in the catalog but you can find them if you go to
http://www.digikey.com/ and search for "carbon composition". But you'll
find they cost $2 each, when they have them in stock!

I HIGHLY recommend that you consider metal or carbon film instead. No,
they don't look the same as the originals.

Tim.

there are circuits where carbon film have a higher failure rate than
carbon comp. Film resistors do not handle pulsed power very well, but
carbon composition does.

That's just a matter of proper derating, though.

And, of course, finding failed film capacitors can be difficult, while
detecting failed carbon composition resistors can sometimes be done from
the other side of the room...

What values are you looking for? I have a few values in my personal
stock. There are some carbon comp on my website as well.

Ceramic compositions are Good Stuff if you've got pulsed power. I like the Ohmite OX/OY series. They're way more available than the carbon comps, available in values that are useful for tube circuits (e.g. 10K and up, unlike a lot of other power resistors) and VASTLY more reliable.

And I've seen metal film resistors glowing orange from vast overdissipation, and when they cool down they're still in spec.

The ONLY thing that the carbon comps are good for are: drifting (usually upward) and charring/burning.

Tim.

2797. Old Microphone Connector

Newsgroup: rec.radio.amateur.boatanchors

A co-worker here at the Radio Pier brought in an odd mic connector and
asked me if I knew
the formal name for it. I answered it was a "mic connector on 50-year
old Ham Radios".
Specifically, it was the type that had a dot of solder in the middle,
and a screw-on ring.
This one was made by Switchcraft. Our chief called it an "Amphenol
Mini". I didn't find one in the Switchcraft catalog, but maybe didn't
look hard enough. Was there a more specific
title for this connector? TNX es 73 de KE9EX

What diameter was it?

If it was about 5/8" or so, it's an Amphenol 75 MC1 connector. They
were used often for crappy unbalanced high-Z microphone inputs on all
kinds of gear, as well as occasionally for headphones.

There was also a miniature version, the 75 PC1, which is about a quarter
inch, and was used for recorder control and for synch signals for motion
picture recording gear.

Switchcraft had both of them in the catalogue as late as 1990 or so,
which is the last time I went looking for them. Connector-World Supply
in Seattle definitely stocks them.

Also shows up on some test equipment (I remember it being the AC input
for a kit VTVM... Allied? Eico?)

Tim.

I have a drawer full of them, but they're mfg by Switchcraft. Part
number on the little yellow tag reads: 250JF

I've had a lot of film resistors develop hairline cracks, or in the case of SMD devices, the metal end caps separate from the ceramic body. There are also places where the temperature coefficient of a carbon comp resistor was used to make it self destruct and save more expensive parts.

I think you may be misreading the tag... the OP's description sounds like
a Switchcraft 2501F:

http://switchcraft.com/products/connectors-53b.html

This is the same as an Amphenol 75-MC1F, but I think the Switchcraft PN is
more common.

Many Amphenol connectors are now made by WPI - at the same Salem, NJ plant
that Amphenol used for decades.
http://www.wpi-interconnect.com/salem.htm

The former Amphenol product lines include the following:

a.. 17/117/177 and 777 Series D-subminiature Connectors
b.. 26 Series Blue Ribbon Rack and Panel Connectors
c.. 77/78 and 146 Series Tube and Relay Sockets
d.. 78 and 86 Series Commercial Plugs and Accessories
e.. 80 and 91 Series Microphone Connectors
f.. 126 Series Hexagonal Connectors
g.. 133/143 Printed Circuit Connectors
h.. 220/221/222 and 223 Tiny Tim® and Mighty Mite® Connectors
Additional Lines Acquired from Amphenol Include:

a.. CNI Series - Environmentally Sealed Rectangular Connectors
b.. CX Series - Various Military Connectors and Cable Assemblies
c.. H Series - Naval Sound Powered Connectors
d.. Q Series - MIL-C-55169 Submersion Proof Connectors
e.. ONO Series - Poke Home Rectangular Coax Contact Connectors
f.. PL Series - Military Circular Connectors
g.. Q2 Series - MIL-C-55169 Submersion Proof Power Plugs
h.. Q7A Series - MIL-C-55169 Submersion Proof Power Receptacles
i.. 45 Series - MIL-C-55169 Submersion Proof Power Connectors
j.. 84 Series - Miniature High Temperature "R" Connectors
k.. 89 Series - Submersion Proof Power Connectors
l.. 93 Series - Poke-Home Rectangular Connectors
m.. 94 Series - Poke-Home Rectangular Combination Contact

Connectors
n.. 126 Series - CNI Environmentally Sealed Rectangular Connectors
o.. 164 Series - Military Power Connectors

I have a good supply of the shorting version of the 2501MP that
shorts an input when there is no connector screwed on. Switchcraft no
longer lists this version in their catalog.

Looking for an old vibroplex bug condition not a problem, some pitting
and a little rust is ok.
Please email me at n2wjw@yahoo.com with details and price.

Thanks, Gil

2815. Small Coaxial Cable Labels?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-23 19:09:48 UTC
From: Barry <n4buq@knology.net>
Message-ID: <2abe0$44c3c839$18d649b3$28098@KNOLOGY.NET>
Source record: 11615

Does anyone know where I can get some small labels made for some coaxial cables? Specifically, I'm looking for something that will wrap around a 0.085" OD coax. I'm thinking these are made somewhere, but not sure where to look.

I'm restoring some of the interconnecting cables in an R390A and not sure if I can fit the old, metal ones back onto the new coax. One of them had a yellow label that slipped off the old coax rather easily. I slipped it on the new coax and secured it with some clear heat-shrink tubing. I'd like to do the same for the other cables.

Thanks,

Barry - N4BUQ

If you're making new cables, you can do what I do to ID cables.
I buy shrink tubing of the appropriate size, and prior to shrinking
it over the cable write on the tubing with a Fine point Sharpie.
The lettering shrinks along with the tubing and looks ok when
finished.

I just make some paper labels using my word processor program, and print them on my laser printer. I wrap them around the wire, and slip a piece of clear heat shrink tubing over the label.

Note, pick a font that is readable on the size wire you are labeling.

Oh, I forgot to mention, make the labels with the ID number repeated like
this:

J212
J212
J212
J212
J212

When you roll them up, J212 will show up in multiple places around
the tag. You can use some scotch magic transparent tape to hold
the label to the wire before you put the heat shrink over top.

I'm wondering about the lifespan of paper labels. I suppose the laser print
will not fade as easily as color jet print, but I'm thinking the label
itself doesn't hold up well over time. Perhaps sealing it under shrink
tubing helps with this. I was hoping to find someone who makes these in
some sort of plastic, teflon, etc. The one I replace on this R390A is
probably over 30 years old and still very clear.

I used to use a typewriter on address labels for custom cables and put clear heat shrink on them. Some were still around 30+ years later and still looked great. The labels reduced the number of stolen cables, but didn't stop the thefts.

Microdyne still had the blanks and printer for the Mil spec heat
shrink cable markers when they shut down the local plant. They no longer
used it, and I don't know what happened to it, but I would like to have
it in the shop.

Yep, I have restored 6 HW-30's and 99% of the carbon comp resistors were over 20% out of tolerance, they were old however. I replaced all the components with new ones (incl.carbon film resistors)and brought these radios right back to perfect operating condition. I would never install carbon comps in a restoration project even for the looks. But that's just me.

I have plenty of laser printed documents that are well older than 20 years,
and they are as clear and crisp as the day they were printed. The toner is
a fused plastic/carbon compound. It will not fade in your lifetime. Paper
can be had in all varieties and grades. Even if you buy the cheapest copier
paper it will last for your lifetime under a piece of clear heat shrink tubing.

I have delivered labels made this way to the US Army on equipment I have built
for them.

I use the Brother "P-Touch", Model PT-1400 label maker, available from Staples or Office Depot. Its not too expensive and has a variety of label materials. Although they appear to stay put on coax (RG-58, 214, et al)alone, I do use the clear shrink tubing retention method. I got the cue from a Telco installation team at one of our commo sites. They stuck them on and they're still there, a year or so later. de K3HVG

I've done the same thing, except the labels were handwritten (block
letters, obviously).

Was a trick I learned from a radio station engineer I used to ride with
back in my mid-teenage years.

This method certainly looks more professional than tags hanging from
the cable - or even those little digit strips that you'd wrap around
the wire to make up a code. Anyone remember THAT???? UGH!

2834. Hallicrafter's S120 BFO control...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-24 21:21:33 UTC
From: Robert Sherrod <rtsherrod@mchsi.com>
Message-ID: <xRaxg.51500$FQ1.30705@attbi_s71>
Source record: 11634

Hello,

I am in search of a replacement potentiometer for the BFO control on a Hallicrafter's S120. It is a 1.5K ohm, 1/4 watt with switch. The shaft is approximately 5/8" long with a 1/2" long flat. I believe the potentiometer is a Centralab as it states on the back of the switch "Centralab Model 2".

Also, if anyone has a one of the small knobs, black with bright insert, for an S120, I would also be interested. It would save me the trouble of repairing the one that was damage with the potentiometer.

Any help would be greatly appreciated.

Thanks,

Bobby

2837. Input circuit for grounded grid amplifier with 2x 813

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-25 05:02:54 UTC
From: df9gr <df9gr@darc.de>
Message-ID: <1153803774.211656.116110@b28g2000cwb.googlegroups.com>
Source record: 11637

Hello,
I got a pretty old amplifier with 2x 813 tubes in grounded grid. It runs
nicely with 700 to 850 watts from 80 to 10m. I already did some
modifications (vacuum relays, fan control, 8 band operation (80-10m)
and now I am looking for some ideas for an input circuit. I meassured
the input impedance of the tubes with about 120 to 130 Ohms which gives
a bad SWR on a 50 Ohm output stage of a modern transceiver. I also
tried a 1:4 UNUN. Results where slightly better but the SWR is still to
high. As I want to avoid the use of an external tuner I am looking for
someone out there who has build an input circuit (e.g. 1 collins
pi-filter for every band) and can give me some advice how to calculate
or build.
tnx vy73 Rene DF9GR

2838. resistor on 6jb6 screen?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-07-25 08:24:54 UTC
From: francesco.messineo@gmail.com
Message-ID: <1153815894.576052.86870@s13g2000cwa.googlegroups.com>
Source record: 11638

Hello,

I am restoring an "old" drake TR-6, I just noticed a 100 ohm resistor
connected between pin 1 and pin 7 of
the three 6JB6 finals. I understand these two pins are both connected
internally to the screen grid, so
I wonder what's the purpose of those resistors which should just be
shorted by the internal connection
of the tubes. Looking at the TR-4 schematics I saw they have 68 ohm
resistor in the same place, so it
surely has a meaning but I can only guess it's a sort of protection in
case of a failure.
Does anyone know what they are for?
Thanks and best 73

Source record: 11642

Still having trouble with voltage drop when tuning my Swan 700CX.. At the power supply the high voltage is well over the 800 V specified, but when I switch to TUNE. The voltage rapidly drops to less than 400 V. The output on cw is only about 50 watts and less than that on SSB. What can I check with a voltmeter and where do I check? What parts might be involved. I have tried 2 different power supplies with the same result

Sounds like your final tubes are drawing excessive plate current.
Remove the finals (don't just remove the plate caps),
and repeat the voltage measurement.

FS Collins 32V-3 AM/CW Transmitter
Cabinet is a primer gray, no dents on cabinet. Its great.
The front panel was perfect until
I had a radio near it and scratched the paint. Its not a grooved in
scratch, just paint came off. If you can match the paint where it came
off, it will look great.
Works 100 Percent and with GREAT audio reports. Has a newer Peter Dahl
Power Supply installed.
I used it for about 7 Months and just recently stopped using it.
750.00 Looking for a local pick up. But if you want to take a chance
on shipping.
You pay shipping and insurance.
But Don't hold me to damages.
Its heavy and can get banged around in shipping.
I can pack well.

I am looking for a working SBE-33 and any accessories (mike, Codapter, calibrator, etc) for the SBE-34.

I am interested in these transceivers and am trying to capture some of the hardware before it's all gone.

I'd appreciate an asking price with your reply. Send email off list to Ken wa4sqm@arrl.net.
Thanks!

> internally to the screen grid, so

Looking to the schematic diagram, that resistors are in series to the screen, so originally they could not be shorted by the tube.

Are you really sure that the resitors are connected between pin 1 and pin 7? They often use the unsed socket pins as standing posts. So, if the resistor would instead be connected between pin 1 and pin 9, then all would be explained (pin 9 is unused).

Does the wire taking voltage to the screen go directly to pin 1 or pin 7?

Another explanation is that the previous owner, wanting to have a little more power, moved the resistors from pin 9 to pin 7, so effectively shorting them. In this way he could easily restore the original configuration by just resoldering the resistors and the screen feed wire.

I have the original schematic and it shows the 100 ohm resistor between
pin 1 and 7, you can find the
TR6 schematic at the following link (look at the last page of part 2):
ftp://bama.sbc.edu/downloads/drake/tr6/
You can see the 100 ohm resistor between pin 1 and 7 of each final tube
and the additional 100 ohm
in series connected at pin 7 of each tube, which isn't actually correct
as in my unit only one tube
is connected this way, the other two are connected to pin 1.

Thank you and best 73

Pin 1 and pin 7 probably connect to opposite sides of the screen. Perhaps
the inductance of this connection creates an opportunity for a VHF parasitic
resonance, and the 100 ohm resistor is there to dampen it out?

-Chuck

Yes, this can be the reason, thanks for the hint!
Probably is anyway a good thing to add similar resistors in a home made
tube linear.

Have you called Heathkit for a copy of the manual ???
They do continue to supply that service.

Manual photocopies are available for many old Heathkit products for a
nominal fee. To inquire, please have the exact model number ready and call
800-253-0570
http://www.heathkit.com/

Surely you mean QST.

And, 1994 doesn't even come close to being a boatanchor, even if one could stretch things to allow magazines related to old equipment as appropriate here.

Once again, you've made the really common error that this is a buy and sell newsgroup, and thus anything you want to sell is allowable here.

Yeah, but a solid-state amp wouldn't need a device intended to replace a
rectifier tube.

Not a Johnson fan- but I have seen Johnson "tie bolts" advertised in ER- if this is not what you are looking for, perhaps Harold or someone else can tell me what these "tie bolts" are.

Tnx,
Dale W4OP

Looking for power X-former to replace one from National NC-125
boatanchor RCVR which shorted secondary to chassis two evenings ago.
Need 117 vac primary, secondaries 300 vac @ 100 ma, 6.3 vac filaments
@ 3 amps, 5.0 vac @ 2 amps optional. (I can convert rectifier to solid
state.)
Will pay fair market value for new old stock and shipping. Less for
R.F.S. used slavage.
I will be at Tompkins County ARC hamfest at the Tompkins County NY
airport Saturday, 5 Aug. until 10 am, and could deal there with advance
e-mail connection.
Let me know if you've got one of these in your junque box.

73, de KC2LVQ

Hi

I have nice RX, Watkinson-Johnson WJ-8730 and a Digital readout DRO-302A
Both are in wery good condition and working fine together. Even the DAFC
is working! Only in low band 20-90MHz the DRO indication is wrong. IF is
different in low band?

picture: http://www.tarkastaja.com/~janne/rx/P2210024.JPG

I am looking for schematics or any information about those nice equipments.

I bought those from Finnish airforce surplus sale. RX 50 Euro and DRO 20
Euro :-)

**Nope. Not for them either. Way too little current. I figure a tube DAC
would consume several kW of HT and be slightly larger than a 5 bedroom home.

2903. Drake TR6 repair help

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-04 08:16:16 UTC
From: francesco.messineo@gmail.com
Message-ID: <1154679376.119783.125170@p79g2000cwp.googlegroups.com>
Source record: 11553

Hello,

I'm trying to fix a Drake TR6. The receive part is working quite well.
It is powered with an AC4 power supply and
I changed all capacitors and diodes on the AC4 with new ones, I checked
all voltages and they looks ok, bias
is about -57V in order to have idle current on finals to about 100 mA.
The problems seem to be in the TX/RX relay commutation. When ptt is
pressed (in SSB mode) the relay
commute but with a buzzing sound for a split second, then stabilizes.
During the buzz the s-meter goes
to the end of the scale, then it goes off as it should. Using vox on cw
does the same thing. I checked
DC voltages on the 6EV7 tube and they agree with the chart reported on
the manual.
I have no new 6EV7 so I tried to use an ECC85 instead and after one or
two rx/tx commutation the
relay gets stuck in tx mode so I have to power off the unit to release
it. I thought about a possible parassite
oscillation on the vox amplifier triode and tried to disconnect C141,
but the behaviour is the same (6EV7
buzzing before commutation and ECC85 gets stuck in tx). I changed also
the bypass 10 uF electrolitic on the
vox amplifier cathode , but obviously it didn't help. Now I don't
really know what to do next. I'm trying to find
a new 6EV7 but somehow I doubt it's really the tube that generate the
problem, the ECC85 parameters
are enough close in my opinion and it shouldn't behave so badly when in
place of the 6EV7. All resistors around the vox amplifier and relay
amplifier measure correctly. Can be a defective relay? What else should
I check?
Thanks in advance.

Francesco IS0FKQ

Clean the relay first -- it is the most likely cause of your problems.

On 4 Aug 2006 07:52:43 -0700, Charlie Nudo of Drums, PA masquerading
as "CAINE" from his <bb69@epix.net> Google Groups account spammed:

>http://cgi.ebay<snip>

DO NOT BUY FROM THIS OFF-TOPIC SPAMMER AND DIRTBAG SELLER!

This spammer and eBay fraudster, Charlie Nudo of Drums, PA, aka
66fourdoor on eBay, is yet another annoying eBay spammer, as well as
an eBay cheat and crook. He's obviously under pressure now due to my
efforts, as he's sending my ISP and othe net ops messages threatening
legal action if they don't shut me up...ain't gonna happen! Don't be
beguilded by his "great feedback," either...take a look at his
attempts at extortion and his "buried" bad feedback at:

http://toolhaus.org/cgi-bin/negs?User=66fourdoor&Dirn=Received+by

Also, take a look at his retaliatory bad feedback left for others at:

http://toolhaus.org/cgi-bin/negs?User=66fourdoor&Dirn=Left+by

This guy's a proven nut case and crook. He defrauded me twice under
two different eBay account names, one having been shut down since then
for fraud.

Do Usenet a favor...turn this creep in for spam today at:

spam@ebay.com (account 66fourdoor)
groups-abuse@google.com (use email account he used in his spam)
abuse@epix.net (main account POP3 address thenudofamily@epix.net)

...and do NOT fall victim to his scam auctions!

You should also include the distance from the centers of the mounting bolts on each side. These sizes are mostly standardized, and you want both an electrical match and a physical match.

Antique Electonic Supply lists a number of replacement transformers in their catalog/website.

rec.antiques.radio+phono is another good place to post your request.

Hello-

Recently, I posted regarding a BC-348 project I was working on. Well, the radio is now fixed, I took a few photos, and wrote up some text with regard to the radio and the adventure of repairing it.

If you are interested:

http://www.hpfriedrichs.com/rr-bc-348.htm

Listen at: http://www.ourmedia.org/node/250909

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

NEW RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software. We've been having trouble with our Ourmedia RSS feed, so Mike (software wizard that he is) has homebrewed his own RSS feed. In order to subscribe to SolderSmoke, point your podcast software to:

http://kl7r.ham-radio.ch/soldersmoke.rss

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your

computer.

http://www.ourmedia.org/node/250909

Here's the homepage for our show. All our programs are available here. There is also a blog and links to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

Vol-Sql / ON-OFF switch for this 28mhz amateur radio xcvr..
R/S has none in stock.
Anyone know of "parts unit" or supplier who might have?
Tried the usual large suppliers to try make one not have either .
tnx al

Hi Pete - youve done well - a good job. It was too far gone for
restoration, but your repairs are in sympathy with the device and are
not vandalism. Nice workmanship.

73 de Andrew VK3BFA.

Rare, hardly, they can easily be found. New, old, even WWII new in the foil.
Like the other EbayTard that had a 1968 Evinrude advertised as 'Rare'
and wanted $2900!!! The motor wasn't even worth $300.

Pete, superbly done! Thanks for sharing... I am inspired to get on
with my own BC-348 restoration - but you have set a standard! Mine is
totally original, undamaged, and still works, but not quite as well as
I would like. It still has the dynamotor - I use a brewed up 28 VDC
p/s. Perhaps a Winter job...
Cheers,
Roger

That may turn into a dangerous solution.. it's good that you don't
recommend it. I would think that a 'turn to turn' short is more likely
than a turn to frame short.

If there is more than one turn of the winding being shorted, the turns
ratio will be changed, altering the output. The voltage on the out side
goes up if the primary winding count is reduced and it goes down if it's
the secondary windings getting together.

2930. FS S-Metesr for Collins 51-J/R-388

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-07 11:43:56 UTC
From: K3HVG <jeepp@adelphia.net>
Message-ID: <OuydnQoFy-Itu0rZnZ2dnUVZ_qWdnZ2d@adelphia.com>
Source record: 11580

I have two S-meters for sale that go in R-388 and 51-J-series Collins receivers. One is a Burlington, seen in most R-388's and one Honeywell seen in later 51-J-series receivers. The Honeywell has a slightly convex glass design, the Burlington is the conventional flat face. Dial scales and movements are identical. Condition: Exc.

Either on $45 plus postage/shipping/insurance of your designation.

Regards Jeep/K3HVG

I have what may be a few-of-a-kind (or one-of-a-kind) R-392 receiver. Its 99% the same as a standard R-392 but has a Collins/Navy contract number. Its s/n 2. The color is also the darker Marine Corps OD paint and the front panel is held with twist-dogs instead of hex head screws. The case appears a bit more massive that the others I have.. but same overall size. Its all factory, though. The set works fine. I've never heard of the Navy/USMC buying/using the GRC-19, but maybe they did. Or, maybe they just bought receivers to replace the GRC-14? If anyone's has add'l info and/or interested in the unit, please let me know. I already have sufficient R-392's for my GRC-19 setups.

Yes, it is a boatanchor (its got tubes...) - chasing a PA bandswitch
for a ts520S Kenwood, part no S01-3401-05. Anyone got one lying
around?........have spend enormous amounts of time fixing myriad faults
in this thing, failed the final "smoke test" .....very annoying... NLA
from Kenwood. My email address for reply is
woofferau-at-hotmail.youknow what.

Andrew VK3BFA.

Link to Gettysburg photos showing the Gettysburg battlefield before superintendent John Latschar's ego ran amok and ruined it.
http://users.snip.net/~hart/

We loved Gettysburg: married there, took dozens of week-long trips, spent many thousands of dollars there, and even considered moving there. But those days are over thanks to park superintendent John Latschar. He's ruining the Gettysburg battlefield. He calls it restoration. Desecration is more descriptive. If we spent another dime we'd be supporting the destruction. We refuse.

Trees are being ripped out wholesale. The deer have been slaughtered. Visiting on a November evening is an experience everyone should be able to enjoy, but he shortened the decades-old operating hours so you'll be ticketed and labeled criminals. He threw up so many one-way signs that traffic in town has become a tourist's nightmare. His nonsense goes on and on.

He likes saying, "The time for comment was during the planning, not now." Well, Bozo, the public DID and continues to comment, but you ignore them. Tens of 1000s have voiced their concern, but you act as though the Gettysburg battlefield is your own private domain to use and abuse as you please. It belongs to the taxpayers, not an arrogant, government-appointed bureaucratic freeloader.

Gettysburg battlefield ghost hunters have been turned away in droves because he equates them with drug users and drinkers. What a moron. Not only is the town losing a fortune toward the local economy, the park is losing thousands of watchful eyes from some of the most respectful visitors. Those with evil intent will always gain access at night as was proven by recent vandalism. Closing the park merely keeps honest folks out. John Latschar has, in effect, given vandals free rein.

Attendance is lagging. He blames everything except his own bumbling. He constantly moans about never having enough money to fix rotting cannons, monuments and buildings, yet continues wasting funds on mindnumbingly senseless projects that divide the townspeople and drives others away. It's typical government ineptness.

Looks like John Latschar sits around dreaming up new ways to piss people off. If he's not shooting the wildlife, cutting down 100s of acres of trees, changing the hours or screwing up traffic flow, he'll devise some other dumbass plan. Chances are he'll eventually move on to another location leaving his mess and debts behind for someone else. It wouldn't be the first time.

What's worse than allowing John Latschar to inflict so much damage to the Gettysburg battlefield? Most of you sit idly by and let it happen without so much as a whimper. Talk is cheap, but a Gettysburg boycott speaks volumes. We're doing our part. Good bye Gettysburg. You were our favorite place on Earth until John Latschar raped you. Now you're just a memory. What a pity and disgrace.

TERRY
W8EJO

2946. BC-342/312 series of receivers.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-08 22:24:42 UTC
From: novatech@eskimo.com
Message-ID: <ebb2va$r9l$1@eskinews.eskimo.com>
Source record: 11446
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

I have noticed that the serial numbers and history of
BC-348 and R-39x radios have been collected at various web sites.

I have a fair collection of BC0312/342 stuff and thought I should start a list
for them. I have been pulling nameplate photos off of Ebay and taking photos
of my own units. As a start I have:

BC-312 SN 236 14598-NY-37 GE
BC-312-D SN 1189 1263-NY-41 RCA
BC-312-F SN 156 2903-NY-42 Farnsworth
BC-312-M SN 10707 31916-PHILA-43 CRV (RCA for Navy)
BC-312-M SN 13013 33060-PHILA-43 CRV (RCA for Navy)

BC-342-D SN 1413 1263-NY-41 RCA
BC-342-N SN 2075 4611-PHILA-42 Farnsworth
BC-342-N SN 178 14364-PHILA-43 Farnsworth
BC-342-N SN 2037 16133-PHILA-43 Farnsworth (rebuilt as OA-65-A by B&W)
BC-342-N SN 2517 4222-PHILA-44 CFN (Farnsworth for Navy)
BC-342-N SN 2837 10651-PHILA-44 Farnsworth

I will be putting the nameplates on a web site (the ld BC-312 is already
up at: http://novatech-instr.com/Ebay_Images/bc312plt.jpg). Anyone have
others to share. It would be nice to have at least one from each version.
According to my docs, there are:

BC-312, A, C, D, E, F, G, J, L, M, N, HX and NX
BC-342, A, C, D, F, J, L, M and N

as well as their LF versions:

BC-314, C, D, E and G
BC-344, D

These were still being used well into the 50s.

Steve.

Bob - Had a TR-4 in the early 1950s. Used a HY75 free running
oscillator modulated by a 6L6. The receiver was a superregen which was
an acron tube, 955 I think. But has been a long time and can't remember
the ohter couple tubes in the reciver.

Enjoy a unique piece of ham history. They were very popular during WWII
being used as the basic radio for the WARTS nets.

Another trick to cure sticking relays in Drake gear is to reverse the leads to the relay coil. Drake used sensitive DC relays that would eventually magnetize. You could take the relay out of the radio and demagnetize it, or just reverse the current flow in the relay every few years - much simpler!

Here are some items for sale. Prices do not include shipping. I will
ship overseas.

Swan 600R Custom Receiver with SS-16B Filter....$350 plus shipping
This radio covers 80-10 meters and matches the Swan 600T transmitter.
The custom model comes with the Noise Blanker, Variable Notch Filter,
and 16 pole SS-16B SSB filters.The radio is in excellent condition and
receives well. The insides of the unit are also very clean. The power
transformer has been replaced and the new one can be seen in the last
photo. The only other issue is that one of the disks is missing from one
of the knobs.
http://members.cox.net/radiodx3/swan600r.JPG
http://members.cox.net/radiodx3/swan600r4.JPG
http://members.cox.net/radiodx3/swan600r3.JPG

Rareï¿½ National Radio NC-45.............$125 plus shipping
This is an 8 tube receiver made from 1941-1945 covering 550 kHz to 30
MHz. Most models made were made the NC-45 which is an ac/dc receiver.
The NC-45A has a transformer operated power supply. This radio does work
and receives signals on all bands but it really need to be recapped and
aligned. Cosmetically OK but also needs to be cleaned up. It has all of
the correct knobs and I do not find any extra holes. The insides look
OK but also need to be cleaned up. One interesting thing that I noticed
is that the main tuning and bandspread knobs are both weighted, rather
heavy and appear to have come from the factory that way. I do not have a
manual but they are available from several sources on the web. I will
include a schematic.
http://members.cox.net/radiodx3/nc45rcvr.JPG
http://members.cox.net/radiodx3/nc45rcvr4.JPG
http://members.cox.net/radiodx3/nc45rcvr6.JPG

Kenwood TS-520 Transceiver..............$120 plus shipping
The unit is in very nice shape cosmetically and is compete. The receiver
works very well but the transmitter is not working. The insides are
complete and in good condition.
http://members.cox.net/radiodx5/ts520.JPG
http://members.cox.net/radiodx5/ts5204.JPG

Motorola 51X19 Wooden Table Radio-Brown Plaskon Grill...$100 plus shipping
This is a 5 tube radio from 1942. New electrolytics and most of the
paper capacitors have been replaced. The set plays well. Cosmetically it
is in in nice shape although their is a small chip out of the top near
the edge which can be seen in the photo and the plaskon grill has been
carefully glued where it had cracked.

http://members.cox.net/radiodx5/motorola51x19.JPG
http://members.cox.net/radiodx5/motorola51x194.JPG

Ten-Tec Power Mite PM3 and Matching AC Supply.....$200 plus shipping
TenTec Power Mite and Matching AC Supply with instructions and original box. This is a late 1960's - early 1970's 2 band QRP transceiver that covers 40 and 20 meters, CW only. Output power was measured at a couple of watts. The radio works and is in pretty nice shape with a few small scratches.
http://members.cox.net/radiodx5/tentec_power_mite.JPG

Harman Kardon A-10 Allegro Vintage Hi-Fi Amplifier....$60 plus shipping
This is a mono unit with a pair of two 12AX7's driving a pair of 6BQ5's. The rectifier tube is a 6V4. I powered up the unit and it has bad hum so it needs new electrolytic caps. The unit is in nice shape and includes the original box but no manual.
http://members.cox.net/radiostuff9/allegro_hk.JPG
http://members.cox.net/radiostuff9/allegro_hk3.JPG

Heathkit IM-10 VTVM.....$20 plus shipping
The unit is working. It does not include test leads. The test lead uses a standard 1/4 inch plug which is included and banana plugs which can be obtained from Radio Shack.
http://members.cox.net/radiodx3/heathim102.JPG

Big Steel Louvered Cabinet - 19 inch Rack Panel for Homebrew xmtr or Linear Amp.....$50 plus shipping
This enclosure has a hinged top also. The dimensions are 22 inches long by 10.5 inches high x 16 inches deep. The size of the front panel that will fit this is 19 inches wide by 8.5 inches high. Other than some dust, this is in excellent condition and would be a great enclosure for a homebrew ham radio transmitter or linear amplifier.
http://members.cox.net/radiodx3/big19inchcabinet.JPG
http://members.cox.net/radiodx3/big19inchcabinet2.JPG
http://members.cox.net/radiodx3/big19inchcabinet3.JPG
http://members.cox.net/radiodx3/big19inchcabinet4.JPG

Steel Project Enclosure for Transmitter or Receiver....$15 plus shipping
A steel box which would make a nice enclosure for a homebrew receiver, transmitter or antenna coupler. The dimensions are 15 inches wide by 9 inches high by 11.5 inches deep. Their are no dents or dings, it just needs a cleaning.
http://members.cox.net/radiodx3/box2.JPG

Systron Donner Digital Multimeter Model 7241A (DVM).....$20 plus shipping
This unit will measures ac and dc voltage, dc and ac current and resistance up to 20 Mohms. This is in nice shape and is working. I checked it with a dc power supply and a resistance decade box and the readings look good. It also has a tilt up stand. Uses a standard computer type power cord which is included.
http://members.cox.net/radiodx5/systron_dvm.JPG

http://members.cox.net/radiodx5/systron_dvm3.JPG

General Electric YGA-4 Audio Oscillator.....$20 plus shipping
This has been tested and is a working unit.
http://members.cox.net/radiodx3/ge_audiogen.JPG
http://members.cox.net/radiodx3/ge_audiogen2.JPG

This is legitimate, not a scam. The Federal Trade Commision's
web site says so. Check it yourself here:

http://www.ftc.gov/bcp/conline/pubs/credit/prescreen.htm

I did it myself ages ago, and the credit card and insurance
offers really did stop!

73,
Dean K5DH

NO credible screening agency should need to ask for your national insurance number or birthday online !

This is the very worst kind of practice ! It'll soften up ppl for *real* scams in that case.

There is also a complete absence of any mention of an LLC etc - so I'll stick with my original assessment until the FBI tells me otherwise.

Graham

There is *no* mention of optoutprescreen.com there.

You're a criminal.

Graham

Whatever the merits of the site may or may not be, it IS mentioned on
the FTC.gov site. To wit:

Can I reduce the number of unsolicited credit and insurance offers I
get?
If you decide that you don't want to receive prescreened offers of
credit and insurance, you have two choices: You can opt out of
receiving them for five years or opt out of receiving them permanently.
Call toll-free 1-888-5-OPTOUT (1-888-567-8688) or visit
****www.optoutprescreen.com**** for details. The telephone number and
website are operated by the major consumer reporting companies. When
you call or visit the website, you'll be asked to provide certain
personal information, including your home telephone number, name,
Social Security number, and date of birth. The information you provide
is confidential and will be used only to process your request to opt
out.

On the site, if you click the link it leads to the one noted by the OP.

Careful of random characterizations, especially when you are
dead-wrong.

```
It is a scam. What you overlook is that while the process is legit
and exists, the site they're trying to drive traffic to is NOT
legit. To wit, ftc.gov is not optoutprescreen.com

ftc.gov is legit. optoutprescreen.com is held in private registration
and does god knows what with the info folks would provide (which
likely includes SSN and address).
```

Hey dumbass! This is not a phishing expedition but a real opt out
program...no money involved except a $.40 letter..

It occurs to me that it's not entirely clear what Dean meant by
"This." Options for antecedents to "this" include ftc.gov or the
original optoutprescreen scammers. :-)

Dean, if you were just pointing out that the FTC provides for
free/legitimately what the original scammer poster was trying push on
folks in a phishing scam), my apologies for thinking you were
defending the optoutprescreen.com idiots.

You didn't read very far. The site you say is legit,
(http://www.ftc.gov/bcp/conline/pubs/credit/prescreen.htm) lists the
site you say is not legit (http://optoutprescreen.com).

Taken from the ftc.gov site linked above (about 5 paragraphs down):

"Can I reduce the number of unsolicited credit and insurance offers I get?

If you decide that you donï¿½t want to receive prescreened offers of
credit and insurance, you have two choices: You can opt out of receiving
them for five years or opt out of receiving them permanently. Call
toll-free 1-888-5-OPTOUT (1-888-567-8688) or visit
www.optoutprescreen.com for details. The telephone number and website
are operated by the major consumer reporting companies. When you call or
visit the website, youï¿½ll be asked to provide certain personal
information, including your home telephone number, name, Social Security
number, and date of birth. The information you provide is confidential
and will be used only to process your request to opt out."

Well I'll be damned. Indeed it does. Thanks Steve.

In defense of the person who reported the post as abuse to prodigy, I have to agree that it had all the smell of phishing, especially given the mysterious private registration of optoutprescreen.com and the level of detail of info they're asking for.

Even with the mention on ftc.gov, I'm hesitant since it certainly wouldn't be the first time a govenment site was defaced.

This blog entry seems to echo my concerns, and surprise and seems to vouch ultimately for optoutprescreen.com
http://www.gripe2ed.com/scoop/comments/2005/10/25/12231/587/0/post

The whois for the optoutprescreen.com looks really strange to be legit though.

Well..... in that case you shouldn't troll Usenet - NOR ask for social security numbers *ONLINE* !

You are simply dumbing down the public so they'll give that info to any phishing operation !

Your MODUS OPERANDI is *severely defective* !

Note that 'optoutprescreen.com' has *NO* information whatever about a real underlying company (LLC) or Corporation ! The only info on site refers only to the Internet identity which could be *ANYONE* with an IP address !

So, if ppl get used to this idea, what's to stop criminals using the same means for identity fraud ?

This is a fraudster's charter.

No valid agency *needs* this info !!!!

Equivalent agencies operate in the UK requiring only name and address.

Yeah their whois registration data looks really suspicious.

About the only thing a diligent user can hang their hat on, outside
the ftc.gov linking to them, and that links to this site appear to be
all over the place on google from a numbre of apparently legit
sources, is that their SSL certificate appears to have been issued by
Verisign/RSA Security to the following folks:

CN = www.optoutprescreen.com
OU = West Corporation
O = Consumer Data Industry Association
L = Washington
ST = District of Columbia
C = US

Consumer Data Industry Association does appear to be the legit trade
organization of credit reporting agencies.

So, it does appear this is the official, legit place to go, and that
all the crying wolf is not necessary.

The same however can't be said for the much advertised on TV
freecreditreport.com (a commercial venture requiring registration in a
service to get your reports) which ain't the annualcreditreport.com
that the FTC points to.

Best Regards,

This is legitimate, not a scam. The Federal Trade Commision's
web site says so. Check it yourself here:

http://www.ftc.gov/bcp/conline/pubs/credit/prescreen.htm

I did it myself ages ago, and the credit card and insurance
offers really did stop!

73,
Dean K5DH

Is this a US Gov't scam then ?

Graham

I make all of my registrations entirely anonymous too, so what?
It keeps the spam down, and avoids the visits from idiots with
a grudge.

If anyone in authority needs to know who the owner is, Domains
By Proxy will gladly cough up the information.

-Chuck

Geez. A scam within Usenet groups .. Endorsed by the Government ! You
must be kidding ! Never happen in this day and age.

This whole thread is bullshit, and you can report abuse
to whomever ... forever .. and nothing will happen or change.

Look at it as free entertainment.

My guess is he posted in guitar groups because a study that guitar owners
are in the $200K plus range.

Guess he also forgot that many are lawyers and don't fall for scams so
easy.,

I didn't author that post...But, since it is apparent that you are English and possibly in Europe somewhere, this would not apply to you anyways if so. In the U.S., we get many "pre-approved" credit card applications from the credit beauros selling our information to "3-rd party" - read - their own friendly paying credit card , ect. companies for solicitation. This is a simple way to stop them from releasing your personal information to anyone without your permission.
I read about this is a real newspaper and got on their website and got the link. If it is not legitimate, then they are to blame. I am not spamming anything, just posting another link that I think is legit like many others on this newsgroup.
As far as the FBI threat thing, I think they should have more to worry about rather than a link posted in a public - pay for - newspaper. So you should have posted the link to the England bombers secret email than screw with the FBI and - me.
You sir, are a paranoid dumbass and definately a WOMBAT! Go take your meds!

The only reason that I posted this is because I have been working on
cleaning some illegitimate junk off of my credit reports and found
this link. I do admit that is looks "phishy" but it is not...Hope this
stops a bunch of trash can id thieves....M.M.

Um... never stated that answering the post was/was not a good idea.
What I did question was *your* veracity as it applies to calling
someone a criminal.

>There is *no* mention of optoutprescreen.com there.

>You're a criminal.

It was mentioned.
Both the US Government and the reference site are legitimate.
No criminal behavior stated, suggested or implied.

You might apologize. You have proven you are a fool once (here), you
have evaded responsibility for your statement. It might be apt were you
to climb down from your pedestal and make some attempt to be graceful.

Peter Wieck

UK domain registrations do not allow businesses to be anonymous.

It isn't anonymous. DomainsByProxy is the owner of the domain
in the registry. But they are acting as a go between for any
contact between the world and the entity that is actually occupying
the domain.

If you have a problem with a domain in their registry, contact them,
and tell them. They will pass along your complaint to the occupant.
If it something that goes against their rules, they will act accordingly.

You have a funny idea of what 'anonymous' is or isn't IMHO.

That misses the point, however. What if they're doing nothing against the terms of use of the registrar, but are still a privacy invading copycat trying to look like the official industry opt out site?

In the trust game, proxy registrars really shouldn't be involved. It's completely silly for this site to be using a privacy service and a discount registrar than any tom dick or harry with a web site can use to easily and very inexpensively sulk into semi-anonymity.

The use of semi anonymous registrars like this is simply not something that inspires consumer trust.

Given the nature of the site (and the number of competitors in the credit services field who are essentially reselling a free service and using your info for their own purposes along the way, such consumers have a hard time figuring out which one is the "real" canonical site), whoever decided to register that domain with godaddy and do it with domains by proxy made a very amateur decision.

I mean, it's ironic that in order to help your privacy and be diligent about protecting disclosure of your personal information to third party marketers, you have to put your trust (and a lot of it--name, address SSN and birthdate) in a site that isn't registered in whois with their own organization name and address.

I have my domain registered through the DomainsByProxy service, but then again, on these sites, I'm not asking people even for a credit card number much less the complete kit for identity theft (name, address, ssn, birthdate, etc).

Not really, I was just using the term (entirely anonymous) that you used
for sites that use DomainsByProxy.

As I explained, this is a very thin layer of protection for the site owner.
Me personally, I would rather not have my home address on the ICAAN registry,
but DomainsByProxy knows what it is.

No, I am not dense, I understand your point. But as a small business
owner, I cannot handle the great boom of spam mails that come from the
wonderful folks that scan the ICAN registry lists for email and regular
mail addresses. So I use DomainByProxy.

However, the one point everyone seems to be missing is the Federal
website lists:

http://www.optoutprescreen.com

and the website in question is:

http://optoutprescreen.com

Or maybe it is the other way around, anyway, they aren't the
same site. Perhaps the one registered through DomainsByProxy
is a scam?

-Chuck

What if they're doing nothing against
> the terms of use of the registrar, but are still a privacy invading

Using someones SSN for other than a handful of proscribed purposes is
federally illegal. The registrar prohibits illegal activity by its
registrants.

If you look carefully, it isn't. As I said before, the domain listed in
the federal website is:

http://www.optoutprescreen.com

and the one on the DomainsByProxy is

http://optoutprescreen.com

They are not the same site. Perhaps the one on the DomainsByProxy is
a spoof website.

They are indeed the same domain and both point to 199.38.43.105. The use of 'www' is pretty much optional nowadays and most web admins set their server (A records) to resolve both addresses to the same web site. That is what happens in this case.

It is possible to configure it so they go to different web sites, but they don't in this case. Did you even click on them?

My home address isn't listed either but that's allowed for 'personal domains'.

I can't see why a company feels the need to hide their identity.

I don't fault ya for that, for your application (same reason I use
em). Then again, you're not exactly hosting a site endorsed by the
federal goverment pertaining to credit information and pointing the
entire country there to volunteer their personal information to get
off prescreen lists. :-)

> However, the one point everyone seems to be missing is the Federal

> is a scam?

Afraid I have to disagree with you again. First, the original poster
to the thread posted https://www.optoutprescreen.com/opt_form.cgi and
the ftc website points to http://www.optoutprescreen.com/ One click
on the main page yields the same link the original poster made.

But it doesn't matter anyway! http://optoutprescreen.com and
http://www.optoutprescreen.com are the same site, both A records point
to the IP address of 199.38.43.105 which is in the netblock owned by
West Corporation. Finally, there isn't any virtual hosting tricks
going on either--web requests to both http://www.optoutprescreen.com
and http://optoutprescreen.com net the exact results/page.

> Using someones SSN for other than a handful of proscribed purposes is
> federally illegal. The registrar prohibits illegal activity by its
> registrants.

That does little to give anyone confidence though. Check any public
email address box and you can probably find scores of phishing mails
pointing to places doing things that are illegal. Assuming anyone's
caught or prosecuted successfully, the registrar has no way of finding
out unless someone specifically complains. Anyone that sees a Domains
By Proxy registration and thinks "oh, this MUST be legit--I mean, they
have an AUP and all!" is kidding themselves.

> > In the trust game, proxy registrars really shouldn't be involved.

> listed in the federal website is:
> http://www.optoutprescreen.com
> and the one on the DomainsByProxy is
> http://optoutprescreen.com
> They are not the same site. Perhaps the one on the DomainsByProxy is
> a spoof website.

Huh? You may need to look again, and/or gain a better understanding
about DNS and web virtual hosting. Because they are identical web
pages. Filesizes of returned html are identical, text content
identical with no differences.

```
/tmp $ wget http://www.optoutprescreen.com
/tmp $ wget http://optoutprescreen.com
/tmp $ ls -tlar index.html*
-rw-r--r-- 1 user users 11262 Aug 11 13:42 index.html?rf=t
-rw-r--r-- 1 user users 11262 Aug 11 13:42 index.html?rf=t.1
/tmp $ diff index.html?rf=t index.html?rf=t.1
/tmp $
```

Doing a whois on optioutprescreen.com yields DomainsByProxy. A
whois on www.optoutprescreen.com yields an error.

But as I said above, it doesn't matter, the original poster and the
ftc website are consistent, no the site's apparently not a scam, so
everyone should get off MM@DisneyWorld.org's back for having posted
the consumer tip already. :-)

And if I haven't done so explicitly, I wanna make sure I apologize to
Dean for my misinformation way back up-thread. I was shocked to find
that the goofy private proxy+godaddy registration of
optoutprescreen.com was actually the legit site referenced by the FTC.

Best Regards,

Well, I can think of one reason, my business runs out of my home.
I'm a consultant, and have been for 25 years. I never could see a
good reason to rent out space somewhere, it is far more economical to
build a bigger house.

ICANN does no checking of addresses provided to it in the registration,
so it is just as easy to lie there as on the web page. The only time
the address and phone numbers come into play is if they need to contact
a registrant. If the address comes up bad, they will pull the domain.

I'm sorry, I was working off of old knowledge, and didn't check to see
where the links actually go. There used to be a difference between the
two addresses. I guess no more.

As a side note, they do not require a SSN, or DOB. They say that they
will try to prevent the solicitations anyway, but may have better success
if they have the extra information. Which is a bogus argument, as the
letters always come to a snail mail address.

As mentioned in an earlier post, I have a Navy R-392 that uses the large thumb-screw type fasteners instead of standard, hex-head bolts for the front panel. They're like the ones found on RT-66/67/68, their respective power supplies, and many other older GRC/VRC rigs. I need just one of the "thumb" portions. They come off with a screw in the top and lifted (pried?) off the fluted panel-side end. If anyone has a junker unit that they could pull one of the things, I'd appreciate it. It seems the previous owner pulled the tops off one of the fasteners so the power cord could be routed to one side, instead of downward. Tnx very much. de Jeep/K3HVG

HI,

I am looking for a VLF receiver to indulge my new interest. The
few models that I know of are Collins R-389/URR, EECO 880A,
AN/BRR-3, Monitronics-205, etc. I don't know any details about
any of the above, or even if they are what I want. Any
help/advice would be appreciated. Some have suggested a converter
but that would require buying a separate receiver. Thanks in advance.

The National HRO-500 tunes VLF too, although it requires an external preamp for best results.

The great thing about the HRO-500 is that many people think they were pieces of crap and if you find yourself among those people you can score one cheap.

The bad thing about the HRO-500 is that many people think they are a fantastic receiver and well, you can figure out the rest.

I have played with a number of VLF rcvrs. There are some great old surplus
units, also Palomar has a converter that outputs on 3.5 to 4 mhz.
The most fun I had was with a Rycom Selective Voltmeter. They show up on
eBay for very reasonable $$ quite often

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=140018061805

This unit is checked out and operational with the following installed
options:

* RF-5110MD High-Speed Data Modem. In the high-rate
39-tone mode, a channel transmission rate of 3466bps is
achieved by time differential phase shift keying (TDPSK)
of 39 tones which is combined with forward error correcting
to produce data rates ranging from 75 to 2400bps. The
modem is used during digital voice operation.

* RF-5120AFC Harris ALE Automatic Link Establishment.
Please note this is the Harris proprietary "Autolink"
ALE system. It will work with other systems containing
the same option but is not compatible with the MIL-STD-188-141 ALE
most often encountered on the ham bands.

* RF-5130LPC Digitized Voice. Uses the U.S. DoD LPC-10E
(Version 52) 2400bps algorithm.

* Serial Control Interface

Source record: 11380

Hallo

I got a problem with my drake TR-4CW.
Hopefully someone can help.

It is not very much used.
But suddenly it was not possible by help of the RF tune control to get maximum noise or signal when it pointed on " 12 o'clock'' +/-. No resonance.
The more I turn the RF tune from 5 to 0 the more signal I get, but no resonance.
The problem is on 20 and 10 mtr.
No problem on 80, 40 and 15 mtr.

The problem is not only on receive , but also in transmit mode.
That means I can not use the transc. on 20 and 10 mtr. before this is solved.

Testpoint "TP" related to ground:
80m: 1.26V DC
40m: - 1.60V DC
20m: 1.26V DC
15m: - 1.16V DC
10m: - 0.8V DC

What do these values tell you?

Thanks for good advise.

Best regards

OZ5ZD, Bent

There is also the Eddystone 850 which tunes from 10 khz up, made for keeping in touch with the Polaris submarines, the one I have is from 1967. And the RCA R-439a/SRR11 which tunes 10-600, made by Magnavox Co., at least this one is. Uses miniature soldered valves/tubes. I also recall that Racal made a VLF-converter

Good luck finding a VLF receiver, the problem is they were made in very small runs, of 100-200 . Anyone know of a specialized website for these rx's?

Best,

Clemens S.Ostergaard

The Racal 1792 can be made to tune down to 0 KHz with a chenge of
eproms. Mine works quite well down there, although sensitivity falls
off a bit. It _should_ also apply to the 6790(?), but I'm not really
sure.

I have access to a fairly large quantity of new 1 and 2 watt 5% carbon composition resistors. They're part of a lot that will be available for the next month, or so. They all MIL-R-11 made by IRC. The 1 watters are RC32 and the 2 watters are RC42. Varying quantities of most values are available, including many low values in the 0-1k range. The price is $.50 each. If anyone needs any of the above, let me know what values you need let you know. I've already sorted what I need so I'm just passing the news on. Price is plus Priority Mail small box postage.

This kind of upstages last Saturday's club meeting, where one of the guys said he was going exclusively mobile and selling his home antenna and all the gear in his shack because the QRM (he lives in the near field of a 50KW BC-band station) was Just Too Much, and another member told him that his Gap Eagle would look good on the back of his pickup.

I've tried looking for the output of an AF sig genny down there, but I
think it's just _too_ deaf at those frequencies! But it'll tune to
them :-)
I can hear various Naval stuff etc. around 15 KHz ok.
I've not managed to hear SAQ (Grimeton, Sweden) yet when it's on the air,
frequency 17.2KHz. I think I need a better LF antenna.

(SAQ is a *mechanical* alternator transmitter...no electronics at all)

3042. FS: AN/GRC-215 Military Radio HF SSB Shortwave (NOT posted on Ebay)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-14 19:21:00 UTC
From: scr300 <scr300@comcast.net>
Message-ID: <sd6dnfmQstmCUH3ZnZ2dnUVZ_tKdnZ2d@comcast.com>
Source record: 11392
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.swap,rec.radio.swap

Hello. I have for sale a military HF shortwave SSB transceiver, military designation AN/GRC-215

The radio covers 2 MHz to 30 MHz in 10 Hz steps, using a high-speed DDS synthesizer.
It is capable of USB, LSB and CW as well as data.
It comes with EVERY interconnect cable and runs directly from 110V AC or 220V AC. RF output power is 500 watts+, produced by four leisurely-running parallel RF amplifiers using two MRF150 MOSFETS each, with phenomenal linearity and carrier-to-noise performance.

The GRC-215 was developed for deployment in the Western-European Regency Net (in wartime called the FAN or Flaming Arrow Net). This net was targeted to be a tactical "nuclear hardened network", based on shelterized mobile units to maintain shortwave communications on the battlefield when all else has failed (read: After a nuclear conflict). See also
http://www.fas.org/man/dod-101/sys/land/regency-net.htm
Needless to say the radio therefore is built like a battleship, it probably has cost the taxpayer hundreds of thousands of dollars, and it shows.

The regency network was supposed to be deployed in Europe at the end of the eighties but when the wall came down and the Cold War ended, deployment never happened, and the equipment was surplused.
As such, my GRC-215 is NOS, unused.
If you are into collecting military radios, look no further. You will not find a better military HF radio. Only the best components have been used throughout. To give you an example, EVERY RF path in the transceiver is switched using high-speed Kilovac vacuum relays, in both the receiver and the transmitter. There must be like 30 of these relays used throughout the radio, NO switching diodes are used anywhere in the RF paths. The use of these vacuum relays allows fast frequency hopping under full power conditions, but also normal single-frequency operation is possible

It has a microprocessor controlled RF pre-post selector that gives a very narrow RF passband for any frequency selected in the operating frequency range, with phenomenal out-of-band rejection BEFORE the mixers. This pre-post selector allows multiple GRC-215 radios to operate in near-vicinity at maximum power and as close as 10% of the set frequency, without mutual interference. As such, not even the Icom IC-7800 comes close to the large-signal handling performance that the GRC-215 offers.

The receiver uses two cascaded Collins mechanical filters for the ultimate selectivity. The transmitter has its own mechanical filters.
I can go on and on about the quality of this radio, but I will limit myself here to a list of the included components:

- C-11670/G control head using direct-entry keypad and green plasma display
- RT1512/G receiver-exciter (can be 19" rack-mounted)
- TN612/G Pre-Post selector (19")
- AM7296/G quad MOSFET RF power amplifier under CPU control and full VSWR protection (19")
- PP8097/G Power Supply capable of 115V and 240V (switchable) (19")
- All interconnect cables and AC power cables
- First Echelon TM handbook for the RT1512/G receiver-exciter

email me at scr300@comcast.net if you are interested in this ultimate military HF transceiver!
Only serious inquiries please

3043. video walk-thru

This is a video walk through of the "other building" at Nortex Electronics. This has not been seen on the www before. The place is like a maze, with rooms overflowing with stuff, at least 3 rooms with hundreds and hundreds of tubes, and a large bay with 4 long aisles lined with teetering, ceiling-high stacks of old electronics equipment.

file size: 505 megabytes quicktime video, 9.5 miniutes, high resolution 640x480.

internet download bandwidth: 600kbits/second
(start it and go to bed ?)

Get your junque fix.. right-click and save-as! don't even think about trying to stream it.

http://www.bunkerofdoom.com/nortex/obwt/nortex_other.html

/__/\
(* *)
><

This said, for those that recall the old "adventure" game, I took a bunch of still images with four, -N, W, E, S -at each intersection, and was thinking of creating a "surplus adventure" webpage, where visitors could navigate this mysterious place by clicking on a direction at the top of the page. Maybe a 'look' command.. and also finding the flashlight etc.. I guess I have too much time on my hands, and want to create somethingdifferent, no matter how sick or cheezy it is.. I've done the mapping, just have to edit the many HTML files.

"You're in a maze of confusing, teetering stacks of surplus, no two pieces alike.."

I frequently see postings in the ham radio related newsgroups for items currently being offered on E-Bay.

All to often I that items will be shipped only to the lower 48 states, leaving hams in Hawaii, Alaska, and Canada out of the picture. What is the problem. In Canada we are well served by FEDEX and the United States Postal Service. Amateur radio equipment crosses the border with out any problem. I realize that Hawaii and Alaska may be a bit far from the "lower 48" but the same delivery services are available even though surface transportation may be a little bit slow. In the US you also have UPS, the folks in Brown which we Canadians prefer not to use because the often make the border crossing more difficult than it needs to be and we don't like getting stuck with brokerage fees.

So why the discrimination, if the buyer knows that delivery may take a little longer and is prepared to accept the fact then it becomes a non problem. If the seller is intimidated by the prospect of complicated paperwork, he needn't be. Please leave it up to the buyer to decide whether he wants to bib or not.

I can not speak for shipments to Europe, Africa, India, China, or the South Pacific but for fellow Americans, or friendly northern neighbours, I think that people should be prepared to deal with us.

Thanx for letting get this off my chest and I realize that I have cross posted this to four different newsgroups but I wanted to get to a broad audience.

Paul

Don't feel too bad, Paul. You'll often notice in the same listings that
(even if they ship solely by USPS) they will not ship to US military APO/FPO
addresses, either. We get left out in the cold even more often than any of
the above named locations. So much for supporting the troops as it were.--

USPS Air to South Africa takes 4 days from California. Customs is handled by them and it is extremely easy to use. Great service.

Americocentric sellers maybe?

Hmmm???

Hawaii is too hot?

Canada is too big?

Alaska is just right!!

But this doesn't respond to the hypothesis.

That's because shipping to an an APO/FPO is no longer a service provided by the U.S. government. At one time mail to an APO/FPO was delivered to a U.S. millitary post office that then shipped it using U.S. milltary transport, There was a good chance that the mail would actually arrive and it would be undamaged. Now APO/FPO mail is sent via the regular postal system, but the U.S. government picks up the tab.

Now, the chance of the mail arriving is much less as it stands out.

As for Paul's comments, they really don't hold any water. Small sellers don't ship outside the continental U.S. because they don't want the risk.

If an item is lost, stolen, damaged, or takes a month or two to get delivered, they can't afford to replace it, or "eat" the loss. Paul even has more problems because Canadian customs may hold an item to determine its value, or if it can be legally imported as long as they wish. They can also assess the value for sales and other taxes.

Obviously he never has had any experience clearing an item through customs. If he had he would have praised the low fees, speedy processing and general reliablity of the courier services.

Considering the general quality of things sold on eBay, the sellers are actually doing you a favor. While many of the sellers will attempt to keep you satisfied, if you have to wait a month for something to arrive and in Paul's case pay GST (general sales tax), import duty and customs clearing fees, then have to send it back, he would loose a lot.

Besides paying for shipping both ways, he would have to pay customs clearing fees at the U.S. border and prove that the item he is sending back was actually being returned to the U.S. as a defective purchase and not scamming the customs people by claiming it was.

This means that some items both of you either have to keep or pay for and never get no matter what it costs. Where do you draw the line? $100, $200, $500? If it costs $100 to ship a radio to you and $100 to send it back, it does not make much sense.

Geoff.

Been here six years, and have NEVER had anything shipped to me USPS that
hasn't gotten here, and if it was properly packed, it has always gotten here
in one piece. I pay for Priority Mail shipping, which now is only a dollar
or two more than Parcel, and I get it here in a week to 10 days.

And actually, the USPS takes our mail as far as San Francisco via regular
channels, and from there it's shipped commercial air (just like any other
air mail) to our local APO hub, and then to the mail rooms.

I paid $350 for one a few years ago. Where are you located? The size and
weight of these things makes shipping an impractical choice.

The only possible problem is loss or damage. USPS air delivers in a few
days and for a reasonable border fee, most of which is sales tax at this
end. If the customs declaration is made out properly, stating that the
contents are amateur radio equipment and if the eBay auction price is
stated as the value, there is rarely any problem unless the merchandise
is misrepresented in the first place. There is no duty on amateur
equipment entering Canada from ANYWHERE, just sales taxes.

> The only possible problem is loss or damage. USPS air delivers in a few
> days and for a reasonable border fee, most of which is sales tax at this

The issue is cost, I believe.

For some reason sellers dont want to pay the cost to the last two
states, EVEN IF THE BUYER IS FRONTING THE FEES> DOnt know why.

I have shipped to Hawaii several times with no issues at all other than
time.

I have had no problems with Canada, other than time. Sometimes it
takes an inordinate amount of time . But you can accept that if BOTH
parties are good communicators.
>
Keep in touch with your seller or buyer, dont just fail to respond. It
makes them nervous, folks.

3058. LM13-need help-tube filament trouble

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-15 19:57:31 UTC
From: Dave_s <group78@dslextreme.com>
Message-ID: <12e49qfs11va5fc@corp.supernews.com>
Source record: 11408

My faithful LM13, been working for years, suddenly stopped.

Found green oil inside case, oil leaking out the case at front, and no HV at plates and filaments not lighting were the first problems. Found 2 bad oil filled bathtub caps, one leaked oil, and fixed both which restored plate HV to the 67 plate. HV at 77 and 6A7 is unknown now.

A serious problem is filaments of 6A7 and 77 tubes will not turn on unless I do strange things to position those tubes in sockets and then carefully tighten their chassis clamps. HAve to jam styrafoam between 6A7 and metal frame to make filaments light no matter how I tighten tube base clamps.

I see that all 3 tubes pins are barely touching the socket contacts during insertion. Do not know why pins do not push deeply into socket contacts.

Since LM13 worked for years, apparently this shallow barely touching pin to socket WAS OK originally and STILL must be ok and normal. Nothing has changed about this tube set. The filaments all measure 5 ohms. Possibly there is corrosion on the socket contact where tube pin touches. CAIG contact cleaner DEOXIT does not help corrosion.

Using two screwdriver blades to supplement the filament pin to socket contact connections, I can make the filaments of both 6A7 and 77 light up. Their filaments are in series.

Really need help, suggestions, hints with this filamanr problem.
The problem is NOT INTERMITTENT...rock solid.

Thanks, 73, W6MIK, Dave

3060. Old quartz crystals

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-15 21:41:29 UTC
From: Andrea Baldoni <abaldoni@nospam.invalid>
Message-ID: <gvidnUp2-4gUon_ZRVnyvw@kpnqwest.it>
Source record: 11410

Hello.
I want to know the name of the form factor of some old quartz crystals, used in many receivers as 100KHz marker as well in many transmitters as frequency generators...
They are similar in all respect to the small plug-in quartz used in transistor based oscillators, used also these days in the solder-mount thin-pin version, but are more or less double length, height and width.
The 100KHz version is also again double tall.

I have not one here for giving more precise measures, but I'm sure everyone understand what I'm writing about... it has to be a standard because I have a quartz tester with the two sockets: for the big and for the small...

Also, how to name and where to buy the jacks matching a 7-pin miniature tube socket? It's in use as the accessory port of the FT-220 yaesu.
And how about the 11 pin (not miniature) version, accessory port of the FT-277?

Thankyou!

Ciao,
AB

I recently recieved three packages, one from the US via FEDEX GROUND,
another from the US via USPS, and another from Canada via Canada Post.
They all arrived in less than a week, and I paid no customs. There are
no customs duties for ham radio equipment.

Paul

If you can't find the real thing (I have never seen one in the flesh), this article includes the Hallicrafters service bulletin describing how to build an S-meter for the S-40, et. al., along with other info about building your own.

http://antiqueradio.org/smeter.htm

Alternatively, this article describes how you can build a "magic eye" meter for a Hallicrafters receiver (in this case, the S-20R).

http://antiqueradio.org/magiceye.htm

Have fun!

Hi,

Just a wild thought, the oil in a capacitor *is* a dilectric, and
if the socket/s are contaminated with it it might prevent contact
if the fit was the least bit loose. Sounda bizarre but try
cleaning the sockets with solvent and a pipe cleaner. Might just
work! I would use Toluene.

Bill

Recently arrived Manuals
Aug 11/06

I have recently salvaged some Service Manuals as per the list below.
I am making them available for a modest price of $5.00 per 1/2"
Thickness.. PLUS Mailing.

The largest Manual will cost about $30-$35
If manuals are less than 1/2"..cost will be $2.00

I am sure the mailing will be MORE than the price you pay for the
manual...some of the Tektronix and Communications Monitor Manuals will
require additional costs for packaging...unless you pick them up!

Please contact me with any questions directly with Manuals of Interest,
City/Zip and shall advise availability, Manual & Shipping Charges

Several years ago I had a pack and ship business. one of my customers had a VCR he wanted mailed to his son some where in Alaska. The post office used a contract air carrier to deliver the mail to the island where the son lived. As the package with the VCR was being off loaded from the seaplane it was dropped overboard. It took over a month to receive payment from the USPS (he did insure the package).

Hello All,

There is a telegraph key cable (CX-1852/U) for the Collins
T-195/GRC-19 transmitter available on eBay right now. This is a 1950
to late 1960's era vehicular/transportable transmitter. In case anyone
is interested, it is item # 140018079001

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&ih=004&item=140018079001&rd=1&sspagename=STRK%3AMESE%3AIT&rd=1

Thanks.

Nanu

As for canada, there is a problem with tracking. At least a couple of
years ago, the cost of tracking a package, when possible, was
horrendously high. In the case of the US mail or Fedex, it was
impossible. I shipped to canada and the buyer said he didn't get it.
He sent a very impolite letter the day I noticed all other items
shipped that day arrived. I know he received it and later admitted
that it was shipped to the wrong address, which I know better.

Not being able to track makes for a risk that I was unwilling to handle at the time, so I cut out shipping to canada.

As for hawaii and alaska, tracking and shipping costs were terrible to those places as well. Some items can't be shipped by air and would be shipped by ship requiring a time delay in which, again, thieves take advantage of and get their refund.

The combination of eBay and Paypal creates a haven for thieves in those areas and others. They favor the buyer and it will ultimately cost the seller more in the long run.

APO and FPO can't be tracked either. Tracking is a requirement for the eBay/paypal so-called protection.

I was once a gi. Gi's move. Sometimes it takes a long while for the gi to receive mail that has to follow him/her.

I realize that the problems are caused by the 'few', but they create a risk or null out certain protective clauses in contracts. SOme businesses can afford to go through the extra effort, wait the extra time or live with the occasional loss. A business that loses one sale in a hundred can afford the loss better than an individual who stands to lose one in the only one or two sales they make.

Ebay/paypal is too protective for the buyers and not the sellers. The law is too difficult to motivate for most of the little sales that originate from ebay. Thieves know this and take advantage of this at every opportunity they can.

>costs to Hawaii/Pr/Alaska etc I give them the deep six.
> Joe

But the costs are extra to those businesses. shipping to those
states/territories are higher than cross-continent shipping.

Only a month? Not bad, really. USPS is notoriously slow with insurance claims (but then, aren't they all?)

hello phil
thank you for your reply ,but I did build it already,using the schematic out of the S40 manual
It is only that I want to complete my hallicrafers collection that I want an origional meter
I dont think I will really use this receiver,because I have a number of hallicrafters,such as the SX 42 who is far better
I did see the SM 40 some time ago on ebay ,I wait till it comes along again
thanks again
hans

The tracking is not a problem, FEDEX tracking works across the borders
and the USPS and Canada Post tracking systems interface with each other
using the tracking number issued at the point of mailing.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday August 20th 2006
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

There are FT-243 and FT-241 crystals; they have the same form factor,
but the FT-243 has a front plate that comes off, while the FT-241
opens from the bottom. In the FT-243, the quartz plate is not silver-
plated and soldered to the connector pins; in the FT-241, it is.

Both FT-241 and FT-243 crystals will fit in an octal socket.

The 100kc crystals are in tall HC6/U holders. As I recall, it may be an HC13 holder. Those crystals were used in receivers of the 50's and 60's and kept right on going into solid state.

International Crystal Manufacturing once sent me a little poster with
drawings of all the different standard crystal sizes including many of
the older ones. They may well have it on their website.

Thanks Bill, I will try the solvent idea.

I can use ANY ideas from any LM series owner whose LM uses type 76,
77, and 6A7 tubes. I am baffled why the tube pins insert so little into
the socket contacts. Have the socket contacts lost their spring action?
Can I GENTLY readjust my socket contacts?
Do type 76,77, and 6A7 tubes in LM series units really insert pins so
there is only a slight KISS contact at the pin's tip, no real deeper
insertion with good wiping?

Thanks for any suggestions, hints, etc to improve contact between tube
pins and tube sockets. Contacting me by direct email is sure OK. 73,
Thanks, W6MIK, Dave

Is it still an HC6 holder if it's a longer package? For some reason, I
thought those did receive a different designation.

3085. FA: Harris RF-5020 Receiver/Exciter -- update

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-16 15:01:24 UTC
From: ElectronRon@Home.PC
Message-ID: <hcc6e2p79hqndpod5qb80n31fpbhan0g5u@4ax.com>
Source record: 11435

In addition to the 50 U.S. states, I've opened up the sale to Canada.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=140018061805

* Receiver/Exciter (100mw out for driving many military amplifiers)
1.6 - 30 mHz in 10Hz steps from the keypad, 1Hz steps from the serial
interface.

* Digital I.F. with I.F.-based DSP, and DSP-derived transmit and
receive bandwidths.

This unit is checked out and operational with the following installed
options:

* RF-5110MD High-Speed Data Modem. In the high-rate
39-tone mode, a channel transmission rate of 3466bps is
achieved by time differential phase shift keying (TDPSK)
of 39 tones which is combined with forward error correcting
to produce data rates ranging from 75 to 2400bps. The
modem is used during digital voice operation.

* RF-5120AFC Harris ALE Automatic Link Establishment.
Please note this is the Harris proprietary "Autolink"
ALE system. It will work with other systems containing
the same option but is not compatible with the MIL-STD-188-141 ALE
most often encountered on the ham bands.

* RF-5130LPC Digitized Voice. Uses the U.S. DoD LPC-10E
(Version 52) 2400bps algorithm.

* Serial Control Interface

----More details in the sale description

If anyone needs some matching turns counters for a big amplifier or tuner, I
just listed two of them on eBay at:
http://cgi.ebay.com/Inductor-turns-counter-tuner-transmitter-ham-radio_W0QQitemZ160019731066QQihZ006QQcategoryZ1502QQssPageNameZWDVWQQrdZ1QQcmdZViewItem
and the matching one is at:
http://cgi.ebay.com/Inductor-turns-counter-tuner-transmitter-ham-radio_W0QQitemZ160019731672QQihZ006QQcategoryZ1502QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

I also listed a B&W 850A switched tank coil at:
http://cgi.ebay.com/B-W-850A-inductor-coil-tuner-transmitter-ham-radio_W0QQitemZ160019725710QQihZ006QQcategoryZ1502QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

And I put a very nice husky roller inductor at:
http://cgi.ebay.com/B-W-850A-inductor-coil-tuner-transmitter-ham-radio_W0QQitemZ160019725710QQihZ006QQcategoryZ1502QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

There are also some mechanical parts for the Collins ART-13 transmitter,
including a top cover. If interested, check it all out......

Home number is: (979 846-4400). ....Mike.

I worked in a repair shop in Ketchikan, Ak during my last two years in High School. We had a large box of crystals in assorted mountings, that were removed from obsolete fishing boat radios. Most of them were in the 2 to 3 MHz range, so it was easy to grind them up to 75 and 80M.

I agree ......Ahhhhhhh..........good times

Hi all
I am looking for two switches from the TU10B Antenna Tuning units. They are single pole, 6 position and have a 3/8" thick ceramic wafer about 3" diameter coupled to a 2" square mounting plate. They have a 1/4" shaft and 60 degree positioning. They will have a black bar knob with an arrow on it. I need two for an amplifier project and will pay the post to New Zealand plus a reasonable price.

The selection of bulk cable they have appears to be a single roll of
RG58C...
The crimp connectors they have for coax does not include RG8, or RG213,
or 9913, and on, and on...
It took me about 20 seconds of looking at the website to jump away...

3098. T368 for sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-17 13:18:29 UTC
From: KeDawei <dkirkpatrick19@comcast.net>
Message-ID: <V7-dnXuznu858XnZnZ2dnUVZ_tCdnZ2d@comcast.com>
Source record: 11498

For sale - T368E/URT, made by B & W, Serial Number 151170PP62, SR655

The T3 is in excellent shape. I purchase the T3 many years ago from a local ham who got the rig from Fair Radio. It was used for a few years then I went overseas for 4 years. I have recently returned and not active anymore so cleaning out the cellar.

Pictures are here:

http://www.kedawei.com/

Click on T368

Mods:

The only change to the T3 I can remember was to the speech section. I forget what I did but it got good reports. What I did should be marked up on the schematics. Typically whenever I made a change or replace any part on any transmitter or receiver I marked up the schematic for that rig. The change was minor and can be easily traced and backed.

Manual:

The manual was purchased new from the government. The manual for T3's is the same for all models as the variations between models is slight. I was surprised that the manual had A, B and C but that's what you get for ordering any T3 model from the government. I enquired some more and found that there were supplements available for the T3 later models which I have. As it turns out the changes are minor and all you need is the basic manual. As far as I know I'm the only one in the east with T3 supplements.

The picture of the manual shows 5 folders which have extra manual schematic copies and supplements. I made up extras of the schematics as I like to go over them with a felt pen and markup circuits for easy understanding. Although the transmitter is big and powerful it's basically a beefed up Ranger. Even though I have the extra documentation if you just use the main manual you'll probably never notice the changes described in the supplements.

Problems:

Essentially I got the rig many years ago. After a few months I put in the speech amp mods which were minor. When I first got the T3 there was an arcing problem as I mentioned on the phone. That was finally found to be a carbon trace which was wiped away and solved the problem. I think the carbon trace was caused by improper tuning or a non-matching antenna by the previous owner.

After those initial things I never had to touch the rig so used it like that for years and that's the condition it's in now. Years ago I put in new 4-400's so given ham service they should last through your lifetime.

Price: $1600.

Location:

Marlborough, Mass.

yea, don't believe FedEx when they say they deliver to Alaska....They
only deliver to Anchortown, Fairbanks, and Juneau..... for all the bush
villages and towns, FedEx gets turned over to the USPS in Anchorage
for delivery, and there is NO Tracking after that..... FedEx SUCKS
for Alaska delivery..... Lost a Laptop to there system, no refund,
or claim was ever paid. got a letter from the Manager saying,
"So Sorry for your loss, I feel your pain." I'd like to give him
a bit of my pain, right in the ***........

I have several items for sale from an estate that I am helping close out.
Items include:
1. AEA Model PK-88 Packet Controller/TNC, no manual or power supply, $20;
2. Si-Tex Model 950 Scan Marine Transceiver with mic and power cord. Works
and
puts out around 40 watts into my dummy load, Price is $40;
3. Kenwood MC35S Mobile Mic, very nice shape, works great, $35;
4. Yaesu FT-64 440Mhz Mobile Transceiver, no tone board, but outboard tone
boards are
still available. Works, with mobile mic and power cord, see e-Ham reviews.
Price $45.
All prices do not include shipping. Shipping costs will be actual from
79602. No handling fees.
Thanks, Charlie Hugg, K5MBX

From: Peter Hiscocks <phiscock@job.ee.ryerson.ca>
Message-ID: <ec3a52$mq0$7@news.ryerson.ca>
Source record: 11506

I have just put up for auction on Ebay a Boonton Model 190 Q meter. These instruments are useful for measuring the inductance, Q and capacitance of RF components over the frequency range 20 to 260MHz.

This kind of instrument is still in use in some labs for Q measurements.

Starting auction price the princely sum of $1.

FS Yaesu FT-720RU 440Mhz mobile transceiver. This rig has a detachable head. It covers 440 to 450Mhz and runs 10 watts. It works fine on receive, but I can't get anything out of it on transmit. It comes with a Yaesu mobile mic and the power cord, but no manual. Cosmetically, it is in great shape. Price is $35 plus shipping. Thanks, Charlie Hugg,
K5MBX

> Paul

Paul,

The reason is very straightforward. This is a boatanchor newsgroup
and it's mostly geezers who deal in old radios.

Geezers live in the past; WE don't think critically; the same tired
thoughts cycle through our heads. Even worse, many of us
hallucinate and make up reasons. You'll see several in this
thread.

Many geezers (to be fair, not all) are Xeno-phobic.

To them, Hawai'i is FAR away and never having been there, geezers imagine that it's a foreign country with different laws a strange language. In their minds, it's a not that far from Hawai'i to, say, Nigeria or Pakistan. Even if they could call the Honolulu police to report a deal gone bad, they would not be able to speak to them with finding a translater.

On the other hand, a geezer thinks, OK, I'm in Virginia, if a $30 deal in Kansas goes bad, I'll just get in the Biscayne and drive over there tomorrow, demand my money. I have that recourse.

People! As Paul says, Hawaii and Alaska are U.S. States.
They have senators in Washington. They vote for the president. As far as the U.S.P.S, FedEx, and UPS are concerned, those states are, like, right over there.

To Sprint and other fone companies, after 7 or 8 PM, just pick up your fone and those places are a free call. If you pay for wired service, it's 5 or 7 cents a minute.

Here are some actual numbers from www.fedex.com

2 day service - 20 pounds

Virginia to Kansas - $61.85
Virginia to California -$65.83
Virginia to Hawai'i - $66.87

2 day service - 60 pounds

Virginia to Kansas - $151.93
Virginia to California -$166.63
Virginia to Hawai'i - $169.24

About the same price for 2nd day service.

FedEx Ground service - 20 pounds

Virginia to Kansas - $12.70 - 4 days
Virginia to California -$16.03 - 4 days
Virginia to Hawai'i - $48.22 - 7 days

FedEx Ground service - 60 pounds

Virginia to Kansas - $28.40 - 4 days
Virginia to California -$39.08 - 4 days
Virginia to Hawai'i - $114.63 - 7 days

Three days longer and more dollars going ground to Hawai'i. But then Buyer Pays Shipping!

The same tracking and return receipt, the same laws govern the business deal. It takes about the same amount of time.

The reason that they say "lower 48" is that they think it's still 1936. It just comes out. There's no reason other than old

thoughts cycling in old heads like regeneration in a triode.

It's like hollarin' out,

Kids these days!

You call that music!

Dag-nabbit!

I've bought items from Canada and sold to Canada. One thing I don't like about it is that it's expensive to ship across the border. In fact, it's cheaper to ship though Canada to Alaska.

But then, buyer pays.

I just had the experience of buying from China, a DEGEN DE1103. If you don't have one, go over to the Bay and look up the seller LIYPN. $44 for the radio and $24 shipping and insurance. Took about 8 days to get here.

This is the best pocket shortware radio. Check out the reviews on the web. 1 kHz readout, better than 1 uV sensitivity, stable, 4 and 6 kHz filters. Covers 100 kHz to 30 mHz continuous so you can listen to AM broadcast, 160 meters, everything!

I can sit in my car, pull out the whip antenna and copy 7040 CW in the evening. I heard W1AW CW the other day, this is in Virginia.

SSB sounds good. Well, mostly good. I still can't understand the hollarin' on 27,000.

While you're buying and enjoying the DEGEN, think about global commerce and the fact that you just traded with a real foreign country.

Unless something goes wrong. The abuse of international
transactions is legendary. Even eBay, PayPal, et.al. seem
to acknowledge it. As another poster observed, if you are
a large-volume commercial vendor, you can "eat" the
occasional transaction gone wrong. But if you are selling
one-off things (boat-anchors or not) on eBay, etc. it has a
significant chilling effect, no matter what generation you
represent.

3111. FA: Nice Kenwood R-599D with 2 & 6 meter converters!

I have two Eimac 3-500Z tubes for sale.They belonged to a friend who replaced them with two RF Parts 3-500Z. They are guaranteed to have 80 to 90 percent output. They do have some time on them, but are still good. They are missing the heat sinks on the tops. If you have a pair of bad tubes, you can remove the heat sinks on them to use on these tubes. They will be shipped in the foam cushioned boxes used for the RF Parts tubes. Price is $100 for the pair. Or $60 each plus shipping. Thanks, Charlie Hugg, K5MBX

I ship to anyone that wants to pay for it. I do avoid APO/FPO shipping, and not because of scams but because of very very poor delivery chances on anything not a 1 ounce letter.

I sent several boxes of supplies to friends serving in Iraq with the US Marine Corps...most of the boxes languished in a warehouse in Germany for about 4 weeks before being hauled to Iraq...then it was another 2 or 3 weeks befire they actually got the stuff. Needless to say, never ship a puppy or kitten to a war zone. I have one realative that was in Iraq for a year (the last time). I mailed him a Christmas package at the end of October. He got home in February and still hadn't received it.

I ship DX but the buyer has to pay for the shipping.

Yes, shipping to OIF/OEF is very very slow. This is because nobody wants to
go in there. Regular fuel shipments can take 2 weeks to cross the country.
Shipping to APO/AE (Europe), APO/AA (Americas) and APO/AP (Pacific region)
is fairly steady, at least going by Priority. Parcel Post or Media Mail go
by SAM (Space Available Mail) and can take months to get ANYWHERE within the
military postal system. This is because EVERY other class of mail gets
priority over SAM, and some of those parcels don't leave the mil hub for
weeks (stateside).

Hello all, I've inherited my dads old Hammarlund 129, (actually, This radio was by my bedside all my growing years), well my father passed away three weeks ago and I got this beloved radio. It hadn't been fired up in 20 years and there is simply no audio output.`I fully plan to recap this rig, but I'm not sure this is the problem. All tubes fire up, no I have not tested them yet. You fellers have any clues to a possible problem? T6 audio transformer bad?? How do you test this transformer...The electrolytic cap measures excellent voltage at all three terminals, not shorted to case. This will be my first radio restore, and any help is greatly appreciated...Thank You...Randy

Chances are it is one are several of those old papaer caps.

Just start with that and you will never look back.

One quick check you can do however with the audio section is touch the
wiper terminal on the audio gain pot with
you should hear a hum if the audio section is good.

But just recap the set , it does not cost that much to do. Paper caps were
junk from the day they left the factory.

And I know someone on this list will defend the virtues of the paper cap.
whatever.

Source record: 11523

Hi
I have a Collins 75S-3C Round Emblem, and it has worn paint on the left side of the Gain plate. Its right next to the bandswitch. Not the grain on front panel, the worn paint is on the plate. Looks like the person before me, turning the knob back and fourth had his thumb always rubbing against the plate and that worned it out. The letters on the top plate are fine and the right side is fine.
So, does this plate come off and I can get another?
Which would make it alot easier.
Or I have matching paint and I can respray the gray on that side. Not sure how it will match? And the 5 white indicator
lines, how would I get those back on. They are not fully gone. The beginning closest lines to the knobs are there,
but when they extend to where the outer end where his thumb rubbed are gone.
Sorry for the long discription, Rich

Source record: 11524

Hello

I now have one HRO-60, which I have wanted since I did not have $800 in 1965, and it has one part that can cause fatal damage.

It is a dual 40 mfd electrolitic between one of the power transformer windings and ground, and the power transformer is made of unobtanium.

I am quite certain that modern solid capacitors will never short out. Does anyone put them into a can that is about 1.4 inches in diameter and 3 inches high? The can of course is not critical, but that is about the size of the space available.

Any ideas will be gratefully considered.

Jim

Jim, Not knowing if you are one of the purists (and this is meant with absolutely no malice), or not, might I suggest that you simply add a hay-rake terminal strip to the bottom of the chassis, near/at where the electrolytic is mounted and use a couple of readily available tubular electrolytics. The chassis top will look original and only you will know the horrible truth, below deck...!!! Via experience with my '60T, you may find that some of the paper caps are bad also. Its my personal position that one's gear should work properly and via the use of whatever appropriate components are required and available. Having said the above, check with Antique Electronic Supply (AZ). They often have NIB multi-section caps in stock.

news:aLfEg.400583$Mn5.137675@pd7tw3no...
I frequently see postings in the ham radio related newsgroups for items currently being offered on E-Bay.

All to often I that items will be shipped only to the lower 48 states, leaving hams in Hawaii, Alaska, and Canada out of the picture. What is the problem. In Canada we are well served by FEDEX and the United States Postal Service. Amateur radio equipment crosses the border with out any problem. I realize that Hawaii and Alaska may be a bit far from the "lower 48" but the same delivery services are available even though surface transportation may be a little bit slow. In the US you also have UPS, the folks in Brown which we Canadians prefer not to use because the often make the border crossing more difficult than it needs to be and we don't like getting stuck with brokerage fees.

So why the discrimination, if the buyer knows that delivery may take a little longer and is prepared to accept the fact then it becomes a non problem. If the seller is intimidated by the prospect of complicated paperwork, he needn't be. Please leave it up to the buyer to decide whether he wants to bib or not.

I can not speak for shipments to Europe, Africa, India, China, or the South Pacific but for fellow Americans, or friendly northern neighbours, I think that people should be prepared to deal with us.

Thanx for letting get this off my chest and I realize that I have cross posted this to four different newsgroups but I wanted to get to a broad audience.

Paul

Are you getting any audio at the headphone jack? Some receivers turn
off the speaker when you plug in the headphones. They do that by
routing the speaker output through some contacts on the headphone jack
so that when you insert the headphones it opens the speaker circuit.
I've had those contacts get cruddy so you don't get anything out of
the speaker. When that happens you can still get audio out of the
headset. Then again, you might just have one or more bad tubes.

Is there a hum from the audio, and if so does it change with the volume
control?

Check the paper caps... just check them all with an ohmmeter and I bet
you find at least one shorted one. I'd tend to shotgun them all out
myself, but find the problem first before you go swapping the rest
of them out.

The transformer almost certainly won't fail... not unless it's damaged
as the result of a tube or cap failure.

Jim:

The part that will kill your power transformer is C-118, the 0.1 uF capacitor connected from one side of the high-voltage winding to ground. When it shorts, your power transformer is history. C-118 has killed more power transformers in more HRO-60s than shorted filter capacitors. The line fuse will not protect your transformer. By the time it blows, the transformer is gone.

My advise it to remove C-118 and do not replace it at all -- it is not needed.

Source record: 11536

I just bought a FT-101EE and I need to replace the rectifier board PB-1076B. Anyone have a DOA FT-101radio with a good rectifier board you would be willing to sell? The PB-1076B rectifier board was used in all early FT-101's, S/N 25,001 and up, and all FT-101B and later models. If anyone has had experienced with a fried rectifier board, I'd appreciate some advice, it looks like many of the components on the board were fried. Please contact me at blsherm@comcast.net.

3137. Shure 55SW Mike - Impedance match to modern rigs??

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-21 13:51:22 UTC
From: Dave <dave@whassup.net>
Message-ID: <r4eje2p5ve7lf0rtrhlrugqqqrdd4muvtp@4ax.com>
Source record: 11537

I recently acquired a nice Shure 55sw microphone (The "Elvis" Style)
and was wondering if I could adapt it to use on a modern rig
(Specifically a Yaesu FT-990 or an Icom 706 MKIIg.

The Shure has swtchable impedances as follows:

L = 25-50 Ohms (38 nominal)
M = 150-250 Ohms (150 nominal)
H = 35,000 Ohms (40,000 nominal)

According to my manuals the Yaesu mikes are 2000 ohms and the Icoms
are 600 ohms.

I have heard that the Shure was a popular studio mike and can produce
a nice high fidelity sound but can the impedance match a modern rig?

Thank for any advice!

Dave - WK8F

Try the M setting with the Icom and the H input with the Yaesu.

>I have heard that the Shure was a popular studio mike and can produce
>a nice high fidelity sound but can the impedance match a modern rig?

Actually, it's a pretty godawful mike, and it was by the standards of
the day as well. Mostly because of the grille design, which makes for
a very peaky upper midrange in comparison with the EV mikes, and which
also makes for very bad pattern control. With a communications mike, the
pattern control isn't quite as big a deal as for PA stuff, though. Try
it and see if you like it... it'll take ten minutes to make up a cable
so you can decide.

Well C118 is supposedly to filter transients.
You could of course repace it with a ceramic or mylar cap.

Thanks all for the replies guys. There was the typical DC thump when I turned the set on, and now that doesn't even happen... and yes I definately tried the headset to try and isolate the problem. I could also hear the scratchy sound of the pots that needed cleaning through the speaker so it's a little bit of a headscratcher at this point. I will take the tube tester to it tomorrow eve, and try to knock any relative tubes out of the equasion. Can a tube still be bad if it lights and heats up???

Regret to inform but there is no overlay* for a specific function on the S-Line equipment. There is only a single, laminated aluminum panel for each major unit. I purchased a bundle of overlays years ago at Dayton but they're long-gone now. You may have to accept the receiver's current condition or perhaps do some artistic airbrush work to the gray area. I've done it, albeit with some amount of trial-and-error. Regards de K3HVG

WE'VE MOVED! WE'VE MOVED! WE'VE MOVED! Please note new site for SolderSmoke. http://www.soldersmoke.com

Check out a video clip of "The Making of Solder Smoke #30" and "A Video Tour of M0HBR" at http://www.gadgeteer.us/VIDEO.HTM

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.soldersmoke.com

Topics discussed in SolderSmoke #30:

-- Bill goes solar powered
-- Mike and the rock-bound rig
-- Steve Weber's IRF-510 amp
-- QST 50 Challenge
-- Farhan's BITX20
-- New Gadgeteer Video page
-- The earliest homebrewers
-- MIT courses on-line
-- Sound of the Sun, and Jupiter
-- Solar minimum at last?
-- MAILBAG: NT7S, WA8KNE, ZL1SAM, N3UMW, WB7AEI, NE1OB, NS5Z, K8WPE

Listen at: http://www.soldersmoke.com

Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

NEW RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software. http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your

computer.

http://www.soldersmoke.com

Here's the homepage for our show. All our programs are available here: http://www.soldersmoke.com

We hope you enjoy the program. Please send us feedback.

73 from London

I don't have one. Try a 10W light bulb.

I have occasionally seen folks using power resistors for the application
as well. Try 10 to 100 ohms.

Check out any good gun shop or on-line gun accessories site (Caballas,
e.g.) They have small, cylindrical heater units for gun safes. Mine is
about 5/8 diameter and.. maybe 7 inches long, 115v.

3163. R-392 solid state ouput mods?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-23 01:47:56 UTC
From: Steve <zarco@sonic.net>
Message-ID: <44ebb3ce$0$96212$742ec2ed@news.sonic.net>
Source record: 11313

Has anyone out there built a solid state replacement for
the audio output tube in the R-392? If not it would
seem that a power MOSFET, and associated circuitry,
in a tube socket base would be useful.

I'm in the process of building a power supply for
my R-392, and the output tube draws a lot of current.
It'd be nice to do without it.

Steve

I seem to recall an article in "73" about building a solid state
AF module for the R-392. Late seventies or early eighties, by
Gary McClellan (I likely don't have that spelled right, but the
guy wasn't a ham, but did write a fair number of articles at
the time, mostly about test equipment).

A heater de-humidifier unit is a common safe accessory. Some of the
safes even have interior lighting. The electric cord comes through
the back.

3166. French Military Radio - Looking for Schematics

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-23 05:00:41 UTC
From: "H. P. Friedrichs" <noemail@please.com>
Message-ID: <W6ednWJoSPFkfXbZnZ2dnUVZ_tadnZ2d@velocitywest.com>
Source record: 11316

Hello-

This is a long shot, I suppose, but the people in this group seem most likely to know the answer.

I recently acquired a VHF military radio manufactured by Thompson CSF. (If there is any doubt as to its qualification as a "boatanchor" you should try lifing it!) The radio is composed of three parts:

The transceiver itself, with a plate reading:
EMETT, RECEPT ER95B
981 AS 1293
S/N 26.043691 14041

A snap-on module with a plate reading:
BJ231A
S/N 3454

And an external 15 watt RF amp with a plate reading:
AMPLI-HF AM215A
981 AS 1293
S/N 26.043013 7895

It's solid state, and if I had to take an uninformed wild guess at its vintage, I would say 70's or 80's perhaps...

Through some probing with an Ohmmeter and some educated guesses, I've actually got this thing to power up, receive, and transmit a carrier into a dummy load. The outboard RF power amp will not work, however, because I'm missing some signals to drive appropriate relays inside. Also, I haven't yet figured out how to hook up a microphone to the set. Needless to say, schematics would be of great help at this point.

Anyone know of a European dealer in manuals that might have documentation for the equipment mentioned above?

His feedback met my terms on the listing. I really don't have a problem selling to him. He was the first to pay out of the 3 auctions I had up. What he does with the equipment is up to him. The next buyer may end up paying too much, but the receiver itself is in excellent condition electrically and mechanically. Whoever gets it will be very pleased.

He wasnts to keep it dry, not set it on fire.

10 Ohms would dissiapate 1322.5 watts @ 115 VAC

100 Ohms would dissiapate 132.25 watts @ 115 VAC

1000 Ohms would dissiapate 13.225 watts @ 115 VAC

2500 Ohms would dissiapate 5.29 watts @ 115 VAC

Reluctantly, I agree. I, too, would sell to him, because I don't think
I would have the right not to do so if he was the high bidder. I don't
like his sales tactics, but there are many, many sellers whose
practices are far worse.

Hi,

The dampness chaser resistor connected across the fused a.c. line
in the Hallicrafters SX-115 receiver is rated at 2K Ohms, 8 Watts.

It is not cylindrical, but is heat-sinked under the chassis.

73,
Ed Knobloch

Hello,

I had been coresponding with someone before about a manual for a MF-5/VR-4B singer/panoramic/alfred spectrum analyzer, but since then my e-mail got nuked by mr. gates.

The equipment I am asking about is here:
http://www.bunkerofdoom.com/kd5oei/anatest1/index.html

Whomever had a manual for this and had offered to make me a copy or sell it to me, please let me know, I apologize about the e-mail outage. I would really like to get those beasties up and running again, as panoramic adapters.

Thanks,
Patrick

I have the following primed for the Gaithersburg, MD hamfest in a few weeks. If interested, demo and pick-up in Central MD area before the fest.

Colonial TBY-7, exc. condition, w/ spare tubes. $100
Hammarlund HQ-160 & S-100 spkr, vy nice $225
Gonset GSB-100 transmitter, vy nice, works FB $185
AN/GRR-5 Rcvr, rack, canvas, book, ant., cables, works FB $200
Eico 722 VFO, exc. recent cal. $80
LM-13 freq meter, case, book, vy exc cond. works FB $45
TS-323 Freq meter, exc cond., works FB $50
TS-175 Freq meter, exc. cond., works FB $45
Johnson Viking Challenger tx and 122VFO, work FB $150
Hammarlund SP-600-JX26, exc., commercial version
w/factory cabinet and CE SSB Slicer, books. $550
Collins 75A4, stock SSB filter and 2 R-390A am/cw filters
installed, book, 270G speaker, H. Mills refurb. $1250
Case/cabinet for BC-342/312, good condx. $25
Icom IC-A2 Aviation Com/Nav, spkr mic, charger, book, exc. $125
ART-13 cable set (dynamotor and power cables) $75
Chinese 102E HF field radio set, new, absolutely complete. $225
SX-101 (w/ 160 mtrs)(exc)w/ R46B spkr (fair cond) $225
RBM/RBS LF and MF rcvrs, p.s., nice cond, book both: $240
Hallicrafters R-274/SX-73 vy nice cond (but missing dial lock),
book, cabinet $550

Hello all. I'm looking for a circuit schematic to use this tube on 6 meters and 2 meters. So far I'm stumped. I think that this tube was used in some early commercial tansceivers, but I'm not 100% sure. Also would like to know if this is same tube as Motorola P/N 9TS136401
It is the same size as a 5894 but with much thicker plate pins as well as amuch beefier plate structure with an extra fin in the structure for cooling. Even the glass is thicker.I'd even consider buying the final section that used this tube. Any help at all would be greatly appreciated. Thanks and 73

>> WB5CYS

"In part" - the truckers, movies ("Smokey and the bandit" and such) and songs - made CB popular as well. There was a market push back then - many models being pushed - along with antennas and so on. The CB craze died as the man said - long before Cell Phones and so on - came to be. Actually - the predecessor to Cell - was "Mobile" phone - which was quite expensive and perhaps not so reliable or widely available then as cells are today..... BUT still "they" didn't shoot down CB either.

Some day - maybe not for a few years - Cell phones may be a fad..... There ARE still many CBers out there - just not as many as at one time. The Truckers do still use them quite heavily and at that - some use modified radios into 10m. Then too, there are some truckers who've acquired their Ham Licenses and now use it to talk when all else seems dead - traffic wise and so on. I see many homes I "used" to know people who were users with antennas still up - but gave up CB due to what it had become. It was no longer something suitable for "family" use. Maybe now - with WWF and so on sprouting shows saying all sorts of words even with the knowledge of children in the crowds, CB would fit right in - since those once virgin ears are no longer virgin.....

First it was pagers - now cell phones which have taken over our younger generation AND some of ours. Radio - be it ham, cb, 2 way, has all but been forgotten by them. Where WOULD they be with out their Cell Phones? I'd hate to see the reaction if we ever had a "major" catastrophy which knocked out all the cell sites. Most of these people will be without their drug.

Then again - it could be interesting as history does tend to repeat itself to a degree. Who knows, we could see another surge in radio if the right gimmick comes along - accompanied by the right "marketing" techniques.

L.

My Drake R-4B works fine but sometimes when I turn it on the OB2 tube puts on a light show with swirling orange glow brightening up the inside of the radio. It was kind of scary the first time I saw it. Usually when it does that if I turn it off once or twice it stops doing that. Is this a cause for concern? Is the tube going bad or indication of some other problem? I don't have a spare of that tube on hand but I can get one on Ebay for not much. Thanks.

If a part is custom made, a company will usually refuse any knowledge
of the part to anyone other than the company who orderd the production.
I have contacted ALPS about a couple of custom made potentiometers that
I have, and the company even refuses to reply. They are just protection
their investments, and dont want to divulge any more info than
necessary to tthe public.

Steve,
A bit or swirling of color as a regulator tube lights off is not uncommon. Until the tube is in full operation and the circuit being supplied stabilizes, the state of the gas will vary. The tube will also "swirl" if the current is changing, as in keying up a transmitter. If, however, the regulator tube has a defined, white flashing or arcing, then you do have a problem. Typically, a "light-show" coming from a gas voltage regulator in a properly designed and operating circuit indicates a failing tube. In any case, you might want to measure the voltage applied to the regulator tube at the time it flashes on you.
Solid-state power supplies provide B+ almost instantaneously, well in advance of the tube circuits heating up in your receiver. It may be that a temporary, excessive voltage is being applied to the regulator tube, in advance of the circuit(s) being supplied are drawing current. If that's the situation, measure the series dropping resistor's value as it could have changed over time, downwards. Hope this adds something towards answering your question.

Thanks a lot for that information. It is more a yellow/orange swirling that an arcing white. It seems to have gone away for now. I did not fire up my R-4B for most the summer and saw this happen today. I left it on for about ten minutes and then turned it off briefly. After turning it on again it did not do it anymore nor for a couple more off/on cycles. The upcoming Graylake Illinois hamfest is always a great one so I think I will go to get a new tube and make sure I have replacements for all the tubes in my R-4B that usually are a buck or two there. The R-4B is one sweet sounding ham receiver. Thanks again.

I can get one of these for $200 plus shipping. Is this what I need for use on a guitar amp building/repair workbench? thanks...J.P.

Very strange question....

Anyone who builds/repairs guitar amps should know the answer.

jak

8 years ago I could have answered that - the AT&T arm I was in had
access to just about any Bell System documentation (yes, I was the
document "pack rat" in the organization).

If you can find someone who works for Lucent (most recent name for the
Western Electric organization), they might be able to locate info.

3209. National Selectoject, HRO-60

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-08-30 22:48:19 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <ed54jj$9t9$1@reader2.panix.com>
Source record: 11259

Hello.

I have started collecting expensive parts to build something as close as possible in functionality to the original National Selectoject. They can be had, and are expensive, and you cannot buy just one.

Ran into a problem. I have a picture of a Selectoject, and a circuit diagram for a Selectoject, and I cannot get them to match up, logically.

If someone has one of those things, I would like to know, for each of the four positions on its front panel, how it is marked, whether it is a pot or a switch, and what it does when you use it. Perhaps I am easily confused, but I just do not get it.

National used four controls for a good reason, and I cannot figure out how to need more than three. I want my homebrew version to look the same, down to the same shade of gray.

So, please, what is at each of those four positions, and what does it do?

Thanks in advance,

Jim

Nothing strange about it! I am a rookie and am studying about guitar
amps and trying to build a work bench one tool at a time. I have a
Fluke meter and think my next tool should be a tube tester. I have no
clue as to how to use it nor do I have a big wad to buy one with so I
am looking for information instead of just buying something off of
Ebay with no idea of what I am getting. I would appreciate any
information I can get. Thank you...J.P.

I would think ten minutes with a curve tracer would tell you everything
you need to know.

Hell, ten minutes with a DMM would tell you if it was a bipolar or FET,
the polarity, and the beta.

I'd do a bit more studying first. Most Hickocks are good units. I'm
not personally familiar with the one you cite; but any tube tester that
you buy is probably pretty old and should itself be restored and
calibrated. I'd check eBay for price. There is a fairly limited
number of unique tube types for guitar amps, so substitution is an
viable option to checking (although the output tubes in many amps are
very expensive).

I think I'd look into an audio signal generator, several hundred watt
8/4 ohm dummy load and an oscilloscope first...all of which might cost
you less than $200 and be more useful on a day to day basis. Make sure
you have good soldering tools...a good assortment of hand tools in general.

Another thing which is particularly useful when servicing these big dogs
is some sort of a chassis dolly which allows you to rotate the unit
without picking it up....

Jim:
Very similar to a Q-multiplier: One switch to select null or peak, one pot to adjust the null, one pot to adjust the peak and one pot to adjust the frequency. However, by ganging pots, you can effect this with three or even two controls.

But this newsgroup isn't about the repair of guitar amplifiers.
So indeed asking where the discussion is about repairing guitar
amplifiers would seem to be a far more appropriate place.

Now, had your question been whether the unit is good for testing
tubes, that might give a different response.

Drug is the right word for cell phones. And, its not just the kids.
Around my neighborhood we have a lot of retirees and cell phones are being
used by them as well, and quite often. Wife and I can't go to any
restaurant now and not have at least one or two or three people getting
interupted at whatever meal for very definitely nonessential
conversations. We can drive almost anywhere for any local trip and look at
drivers and at any given time we can see well enough to see about 20-30%
are holding something to one or the other ears, and if we are close
enough, can see them or hear them talking, too. Sure, I have one and its
turned off all the time (my justification is, at my age, if I have a
medical problem like chest pains, I want to try to get help, or some
emergency, I can turn the thing on, otherwise its off)

> Then again - it could be interesting as history does tend to repeat itself
> to a degree. Who knows, we could see another surge in radio if the right
> gimmick comes along - accompanied by the right "marketing" techniques.

I think society is evolving in the direction of gadgets and nothing else.
I'm also seeing a lot of people with these little ear "bug" things now.
We're turning into the "Borg." And, there is some plan out there about
the govt going to inject some kind of chip into all of us someday.

Its all overkill, overboard.

You're the second person,so far, that has suggested I get a scope
first. What scopr would you suggest. I like name brands but am not

stuck on them. I just want accurate readings.

I don't know if that "government chip program" is realistic or someone's paranoia playing in - but if it "is" real - I think they may have a hard time implementing it.

Otherwise, I'm in line with you. I too use a cell phone - BUT - I can't stand being called for stupid things.
I have a business and am involved in some major things which require me to be able to be contacted on a moments notice..... There "are" times I use it to make calls on the go - as I often do a lot of traveling locally. Other than that, I expect it to stay QUIET! I much prefer to listen to my stereo in my vehicle. But, when talking, I have a "blue tooth" device so I can maintain control of my vehicle. If need be, I'll pull over til I'm done. I'm also not one to "talk with my hands" as many do - so they remain ON the wheel! Personally, my conversations which I have "are" of my own business and I try hard NOT to talk publicly so others can "hear" it. Some people will rattle off there Social Security, Bank Accounts numbers, etc..... in front of others. HOW DUMB.

But I can say - it SUCKS when you have like 5 or 6 conversations going on around you when in a restaurant, movie theater, etc. It "used" to be, you went to those places to GET AWAY FROM A PHONE and other hassles of life. That the phone number there was given to a baby sitter or someone FOR EMERGENCIES ONLY. A friend of mine often will ask me to join him for dinner at a restaurant - but he usually ends up on his cell phone for the better part of it, which I find a bit annoying. I can "always" eat by myself

without having to listen to others' conversations. He apologizes for it and he's as busy as I am - but still - it is annoying as I try to use those moments to catch up on things of mutual interest and need - where we are involved in social issues.
Yeah boy, some days I wish cells were NEVER invented.

Back on topic - as for CB - as I said, it isn't "completely" dead - it is still used - mainly by truckers. You still have those who use them at home to "crash" for the evening - maybe a chat before bed or something. I know we have a few channels here locally in use as such. I hear stations on SKIP on a few channels and they must be unemployed with some big guns because I ALWAYS hear them. Yes, though I do NOT "talk" on CB much anymore, I do tune in from time to time - especially if bored. Sometimes I'll turn my H.F. rig on in my vehicle which has a general coverage receiver and maybe tune around while eating lunch.

In a way, CB is being wasted, it is still a very viable communications device. It did serve its purpose for many people at some point - be it for roadside help, picking up things at a store at a last minute on way home when your spouse or significant other got on their radio to give the order, road directions, smokey reports - can't forget those, and some even met up and married after meeting on the CB.

IF there was anyone of interest for me to communicate with on the CB, I'd get back on - no problem.
I didn't abandon it "just" because I got into Ham, I got off BECAUSE - most of the idiots about that time were fighting constantly on the air. Most of it was liquor doing the talking. A lot of my chat friends moved on in life or died off, so -..... thus ended my "active" cb days.

CB is only as dead as you want it to be. Hook up a radio and antenna and get your friends back into it - save the "cell" costs and phone charges. If you used it before and enjoyed, you still could today - since it seems most has died off.....

Just my 2 cents.

Well Michael, apparently, I need to rephrase my question. So, here is
a stab at it. I am a newby with some digital electronics in my
background, that is interested in building/repairing tube amplifiers.
It is my understanding that I will need a tube tester to test both
used and new tubes for quality.I am now getting the information that I
will probably need a scope and a signal injecter also. I will have to
learn to use the functions of these tools that I need.These tools need
to cover the frequencys of guitar amplifiers also.
What brands and model numbers of these tools would you suggest I
get, considering I am on a low budget. J.P.

>stuck on them. I just want accurate readings.

You won't get accuracy with a scope. That's okay. You use a scope for qualitative measurements most of the time.

So buy whatever you find that is cheap. You don't need dual trace. You don't need more than a MHz or so bandwidth at best. Tektronix made some fine scopes, but a $10 Heathkit from a hamfest will be just fine for fixing audio gear.

You will want a signal generator too. The HP200CD is decent and shows up cheaply at hamfests.

As far as tube testers go, you want a real transconductance tester, and you want to make sure it can handle typical audio power tubes. So look on the chart for 6550s and 6CA7s and if they are there, you're good to go. Most of what you'll use a tube tester for is matching tubes anyway. Finding bad tubes is usually a lot easier to do by swapping and checking voltages. And for the most part, small signal tubes don't fail much so you're mostly worried about power tubes.

They refuse, becasue custom parts are made under NDAs. If they gove
out the data they can end up in court. Also, a lot of the files are
destroyed after the orders are filled, so the OEM is the only one that
may still have the data.

Yes, you can get an idea, but not the published specs. From the date
code and package they are probably pass transistors for power supplies,
like a 2N3055. The only other place they would use something in that
package would be a ring generator. which would have similar specs.

JP....

I'd go along with what's been suggested so far...though I might
suggest a good isolation transformer, a fused (read: circuit-breakered)
outlet right at-hand, and any DIY guitar amp repair literature you
can lay your hands on. There's one fellow's books come to mind, but
darned if I can't remember his name off the top of my head, he's
written
several books on amp repair and effects-building and repair.
THAT'S lucrative, a purist will pay boatloads for restoring his 1965
Jimi Hendrix
fuzzbox and such, so keep transistorized circuitry in mind as well.

A good lighted magnifying gizmo is always handy.

There are a multitude of musical instrument repair websites; the fun
part is, as with boatanchors, digging up parts. And schematics, tho'
many are available on the 'net. Reverse-engineering skills will come
in
handy, too. Consider apprenticing yourself to a local repair guru;
you'll learn more in less time than you can imagine, PLUS you'll have
access to tools to do the job with.

Homeowners & fire insurance is a good bet as well....

Good luck, and Rock On, JP.

Terry Bakowski

ps
try an Amazon.com search on 'Craig Anderton....', I think that's
the name I'm trying to remember. Also check out: PC-based
osciloscopes, there are several freebie downloads for them. And if
anyone knows how to set up a rig to measure transconductance using a
'scope..please let me know.
It shouldn't be THAT difficult...er..should it? <G>

For those that may not know:

The Amp Supply LK800-A amplifier - also referred to as "Big Boy" came with a
QSK board and dual speed blower.
I believe that this amplifier used three 3CX800A7 tubes -- capable of 3 kW
stock.
It was a two piece amplifier.
RF deck and power supply -- their own cabinets.
The RF deck was remote mountable.

Do you need the entire board? OR just rectifiers or capacitors?

Just to clear things up a little about my last message, when I said
"basically as advertised", I meant that cosmetically it wasn't too bad,
it had all the tubes in it, and didn't have any missing parts. It
cleaned up fairly well.
>From my experience buying radios on eBay, that is a lot better than a
lot of other radios that I have received, even if it was badly out of
alignment, and I had to repair the crystal calibrator variable cap.
I don't do a lot of radio buying, but based on what I have done on
eBay, I have come to not expect very much anymore. I figure it's just
the norm, that the radio is going to need a lot of fixing and aligning.

I'm not defending this guy, but I'm just saying that the radio I bought
from him wasn't any worse than the average radio I've received. Maybe
I've just had a streak of bad luck. (Or that I don't bid high enough to
get the good ones.)

Well, I guess if it was that easy, everyone would have one... I am
half way through my second repair book and am starting to line up
tools for a future bench. I am a hobbyist at this time but might get
into a job thing later if it starts to pay off. I enjoy it at this
level. It's kind od fun to listen to some of those tube amps and being
able to hear things others miss while they are listening to the words.

A lot of brands have their own "signature sound" and I like trying to figure out what they are and what has been done to them. Hearing isn't what it used to be but I can still tell a Marshall from a Vox. And since I am a diabled vet living in a small town on a small fixed income, I have found that I can pursue this by computer and book. There is one old radio guy around here but as far as I know, that's about it. I need to go buy his place and see what he does one of these days. Caught him slipping out of an auction with an old tube radio under his arm he had just bought for nothing. He looked like he was stealing something...so I stopped him and got his address. Guess he got a real deal on that radio.You'd have thought he had bought a gold bar!.... so I figure there is something to be gained from this, maybe some money but mostly some pleasure. I never was that much of a guitar player but always have had one. And after spending time trying to change the sound of the guitar came to the conclusion that the amp is "the sound"! so I am now on that trail.... what the hell, beats waiting for the "Rockford Files" to come on TV!

I'm not encouraging crossposting, but there are much more appropriate
newsgroups for this thread. Foremost, I would try
sci.electronics.repair. There are a number of people there who probably
have more experience with what you are trying to do, than here. For
specifics, like tube test equipment, try rec.antiques.radio+phono.
You're getting some pertinent advice here, but it's way off-topic.

In fact, I'm sure there are even more topical newsgroups specific to
guitars and amplifiers, I just don't subscribe to any of them.

Just about any scope is good enough for audio work. Dual trace scopes are
better than single trace scopes, but dual trace isn't absolutely necessary.

There are now tons of perfectly adaquate TV shop 5 Mhz scopes out there at
give away prices.

From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <pNlKg.4328$B14.2114@dukeread03>
Source record: 11292

I have two nice Collins 516F-2 Power Supplies for sale. Neither one has a
case.
Both have good cables and work good.
1. SN 2623. This one is all original except the power cord has been
replaced. It has the original caps.
The caps function now, but it will need new caps in the future. This is an
early 516F-2. Price is $275;
2. SN 19717. This one has been completely recapped and has had a raised
ceremic tube sockett installed for the 5R4 tube. It also has had a choke
replaced with a non factory type. It looks good and works fine, but is a
different style. I think Bud Whitney, K7RMT still has some of the factory
replacement chokes if one wanted to make it completely original. I can send
pictures. Price is $325
Shipping is extra.
Thanks, Charlie Hugg, K5MBX, CCA #307

Might figure I have asked this question there also but sometimes, even
if off topic, it pays to ask a question where you might get the best
answer, at the risk of being flamed, of course. Alt.guitar.amps is a
good place when you get real answers but also serves as an amateur
boxing ring for political issues and trolling parlor...

3245. FS Drake TR-7 loaded with Filters

Source record: 11195

I have for sale a Drake TR-7 Transceiver, SN 5100. It is loaded with optional filters. It has 2 Sherwood Engineering Filters, the 4kHz AM Filter and the 1.8kHz narrow SSB Filter. It also has the stock Drake SSB Filter and the optional Drake 8kHz AM Filter. It also has a fan. The transceiver is in good shape. It has the new style nonsticky cabinet which is near perfect. The aluminum trim pieces have some nicks. The transceiver works except for the digital readout. It needs work. It comes with a copy of the owners manual. Price is $295 plus shipping from 79602. The filters are worth what I am asking for the radio. Thanks, Charlie Hugg, K5MBX

Maybe he's going to have it "professionally" packed! That "might" make
sense. It is amazing how many people either won't/don''t take the time OR
too dumb to know how to do a decent job. It is "rocket science" to them.

3258. Curious about the I.R.E. Standard Dummy Antenna

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-05 04:51:10 UTC
From: "H. P. Friedrichs" <nospam@please.com>
Message-ID: <1YOdna1FqcOin2DZnZ2dnUVZ_tCdnZ2d@velocitywest.com>
Source record: 11208
Cross-posted to:
rec.antiques.radio+phono,rec.radio.amateur.boatanchors,rec.radio.amateur.antenna,rec.radio.amateur.homebrew

I am interested in the origins and purpose of the "IRE (Institute of Radio Engineers) Standard Dummy Antenna," as used during the alignment of radio receivers.

I first came across this circuit in some old Hallicrafter's documentation, which described the alignment of a particular radio. The "IRE Standard Dummy Antenna" consists of four components--- a 200pf cap in series with a 20 uH inductor, which links the signal generator to the receiver's antenna input. A 400 pF cap in series with a 400 ohm resistor is connected in parallel with (shunts)the inductor.

I gather that this circuit models a wire antenna of some type. Is this true? What is the import of the component values and how were they arrived at? I modeled the circuit in Spice and graphed the transfer and impedance curves but it is not entirely clear to me what benefit there is to using this circuit.

I've also Googled this and found some references here and there, but nothing explains the "why" of it.

Is there anyone who can shed light on this?

Its to match the receiver to the generator.

--
Service to my country? Been there, Done that, and I've got my DD214 to
prove it.

Or more specifically, it's to present a uniform high impedance
from the generator to the radio. At the time, with the exception
of a few lab grade instruments, signal generator outputs were all
over the map with regards to output impedance. The "dummy antenna"
presented a fairly uniform, and high, impedance to the radio and
kept from detuning the front end while doing an alignment while
connected to a signal generator.

Ahhh, so for the very first time, I finally hear an answer to one of those things that I've scratched my head about for years!

I've often wondered why the literature always says to stick a capacitor inline from the signal generator -- I figured if I had to do this all the time, then why didn't the signal generator maker put one in there? Turns out, usually they do, but it's probably not an impedance match. Still, for most radios I just stick the probe to the antenna and go to town. It's fine for the IF -- enough of it gets past the RF to give me a workable signal. Then for RF I use whatever frequency I need to check/adjust the LO. For final RF adjustments I plug in the antenna and tweak it up on a weak station.

Again, I probably differ from most of you because I work mainly with car radios. I already have a pretty decent antenna at the bench -- some $10 special from Auto Zone -- that does a great job. On a conversion there are no RF adjustments; on a repair/rebuild, I can do every adjustment except one, the one which must be done inside the car anyway -- the antenna trimmer. However even this gets checked -- I've noticed that with my bench antenna, the trimmer usually adjusts toward the "high" end, with the screw fairly loose. So if the trimmer tweaks in this area I'm fine. If it tweaks "tight", or not at all, I'll adjust the slug as needed -- or troubleshoot.

Actually it is rare that I ever have such a problem -- with one exception: the 58-60 T-Bird radios. Even these are just fine, usually, but I've had a number of them whose front ends are way off. I've spent many hours trying to figure out why, and come up with nothing. I've replaced RF caps, checked the range of trimmers, checked resistor tolerances, and basically gone over the circuit with a fine tooth comb. Everything checks perfect, but the alignment is out. So I adjust the tuning slug -- a pretty fair distance --

to bring it in line. I've had a couple that were so far off that I had to tinker with the others as well. It's really fun because those slugs are WAA-AAY up in there, and difficult to reach. You can't do it with a non-ferocious screwdriver, or even a ferocious one -- it's too tight. You have to reach the shaft with needle-nose. In any case, all this fun aside, I can tinker and bring it into line -- but I still wonder why I have to do it in the first place.

I think my next step in this "investigation" is to spend time with the next 58-60 T-Bird I get for conversion. If it's a good radio, when I disassemble I'll measure the tuning slugs, trimmers, fixed coils, etc., and write them down for reference.

Maybe the slugs have lost some permeability. Which way do you have to
tune, more or less inductance? Ken

Excellent comment Michael- I should have thought of that option.
The "one owner" comment is fictitious by the way.

I wrapped the rig in so much bubble wrap it would have bounced. Then in a
double thick wall new container- still only $12.
I received a Davco DR-30 several years back that was rolling around in
styro peanuts when it reached me- and this after I implored the seller to
pack it extremely well- even offered to pay extra $$.

I was "trying" to give the guy "some" benefit of doubt at least on the shipping aspect! It really sucks when they lie about being the "only" owner or something similar. Ya have to wonder now - if he didn't screw the thing up somehow so it is junk "unbeknownst" to the eye - and not telling that too.

Had a guy try to sell me a radio once at a flea market - claimed it was "factory". Yeah ok - I found some "hidden" switches and asked their use - he said oh this is for this and that to which I replied - sorry dude - the factory didn't install THAT. NO radio of its kind - make and model - comes from the factory with what this had in it. Caught him in a lie REAL fast. Had he not lied about it up front, I "might" have bought it.

Strange thing about this case - yes the internet is broad and you "can" get lost in it - but the downside is - via searches - you're also vulnerable to being found out too. The less than honorable sellers don't bank on the latter. I've seen many cases with "pirated" pictures and so on to items like this bought and resold under less than honorable pretenses. AND the sellers caught at it - even if only in reference.

Mike was right Dale - could have saved some effort there with the Drop Ship.

L.

Yes, the dummy antenna models a wire resonant at 2.something Mc. I suppose that was taken to be more or less typical of the receiver antennas of the 30s. The dummy antenna's most important use is as a standardized load for measuring receiver sensitivity. Terman's Radio Engineer's Handbook has a few paragraphs on this.

If you're just adjusting the RF coils, peaking them up on the antenna normally used would be as good or better. Any sort of loose coupling between the generator and RF coils will get you in the ballpark with most radios.

Frank Dresser

This doesn't sound right, why would it be desirable "to present a uniform high impedance from the generator to the radio"? The impedance of the "IRE Standard Dummy Antenna" is not exactly what I would call "high" especially on some of the short wave bands, exactly what is a high impedance in this context?

It was my understanding that the purpose of the "IRE Standard Dummy Antenna" was to provide a standard antenna to use for making performance measurements, as well as for alignment at the factory and on the service bench.

As to the exact design of the of the "IRE Standard Dummy Antenna", I understood that it was meant to represent the impedance characteristics a typical antenna that might be used by a radio set owner. This topic has been discussed here before and I seem to vaguely remember that someone may have even dug up the exact nature of the antenna the "IRE Standard Dummy Antenna" was designed to simulate. IIRC if you are only doing MW broadcast band alignments a single capacitor will provide a very good approximation of the "IRE Standard Dummy Antenna" across the MW broadcast band. The coil, resistor and second capacitor are there mainly to provide the desired impedance on the short wave bands where the prototype antenna has resonant effects

There are at least two problems that the "IRE Standard Dummy Antenna" solves, the first being standardized measurements for obtaining

performance specifications, as it is possible for a manufacturer to "improve" his products specifications by using his own specially designed "Dummy Antenna". The second problem is how to align sets in the factory, or on the service bench, when the final users actual antenna system is not available. The problem is that the alignment of the antenna stage of a radio is greatly affected by the impedance of the actual antenna that is used with the radio. The "IRE Standard Dummy Antenna" provides an approximation of what was assumed to be a typical consumer antenna. Of course what you really want to do is align the set with the actual antenna attached that it is used with.

Well put, John.
I have understood the purpose of the 'matching network' for years, but
I have been puzzled by the source impedance expected on the generator
side.
I have several RF generators of various vintages in my collection and
most of the older tube ones have most peculiar output attenuators that
would have impedances that vary all over the place depending on the
setting of the output attenuator, frequency and, to some degree, output
cable length. On 'modern' generators, once you cut in 10dB or more of
attenuator, the output inpedance it pretty close to the specified, but
even many of them are quite a low impedance at 0 dB.
Perhaps someone with spice can characterize the output impedance of the
IRE network when fed from a generator of 0 ohm, 50 ohm, 75 ohm and,
say, 200 ohm output impedance.

I built an I.R.E. dummy antenna recently to perform an alignment on a
Hallicrafters S-120. It is cobbled together on a small perfboard with
copper lands around the holes, has a length of coax with a male BNC
connector to go the the sig-gen and a female BNC connector to attach the
sig-gen lead.

I will post a pic on a.b.p.r when I can.

Pete, I was curious about the dummy antenna, too. Some time ago I modeled it and checked the impedance looking back into the output leads with a 50-ohm generator at the source. The results are here:

http://users.tns.net/~bb/dummy.htm

Before I did the model I figured that the dummy antenna was trying to simulate a certain length of wire on shortwave. But you can see that the magnitude of the output impedance (upper plot) is around 400 ohms throughout the shortwave part of the spectrum. Down in the broadcast band the network becomes almost purely capacitive, which is what a short wire will do.

In fact, at 500 and 1000 kHz (the two spots I checked), the dummy impedance is almost exactly that of a wire that runs 15 feet vertically and then 90 feet horizontally over perfectly conducting ground. I imagine they had a 100-foot wire in mind, a figure I think I've seen recommended for BC antenna length in the old days.

So I think the network is intended to be 400 ohms resistive at SW and at BC behave as a 100-foot wire would. I align radios with the network and then at installation I tweak the antenna capacitors, if they are easily accessible, on the actual antenna.

Brian--

Your spice simulation looked familiar...VERY familiar. As it turns out,
I had plotted similar curves and happened to have used Microcap as well!
I was just not sure I understood the relationship between the transfer
function I saw and some kind of physical antenna.

Your comments make sense, though I do have one question: How did you
calculate the impedance of the antenna with the shape and dimensions
that you described?

Nice charts, thanks for doing those.

> So I think the network is intended to be 400 ohms resistive at
> SW and at BC behave as a 100-foot wire would.

Pretty much what I said initially. A uniform high impedance.
As others pointed out the output attenuator of most "service"
grade signal generators at the time was all over the place.

What I find amazing is that what we can do with Spice in a few
minutes was painstakingly done by hand until the they got the
results they desired. Then published as a "cook book" standard
for others to use.

The bottom line was that you could introduce a signal into the
receiver under test without undue de-tuning of the tuned circuits.

Pete, I forgot to mention the reason I believe the IRE dummy antenna tries to look like a 400-ohm resistive load at shortwave instead of a certain length of wire. You can see why here:

http://users.tns.net/~bb/antlen.gif

This is an old RCA chart showing the behavior of an end-fed wire for lengths to 125 feet. It indicates the many resonances and antiresonances a short wire can exhibit. Since the antenna impedance and the resulting performance vary so markedly with wire length, and because it would be unrealistic to expect all listeners to use one particular length, I think the dummy antenna is just intended to roughly match the input impedance of a typical radio. I'm not sure about consumer radios, but old communications receivers all seem to have a specified input impedance of either 300 or 400 ohms.

On the broadcast band, any wire shorter than about 150 feet will look capacitive. It won't exhibit the resonances you see in the chart at shortwave. So even if the wire is shorter than the 100-foot length the dummy antenna seems to model and exhibits a higher capacitive reactance, it won't affect the radio's RF tracking that much. On the broadcast band, most radios seem to use rather loose antenna coupling to minimize mistracking. This allows them to accomodate antennas of various length. There is an interesting discussion about antenna coupling strategies in the Radiotron Designer's Handbook.

I suppose he's trying to save some money, but yes, every time I see something like this post, it makes me wonder if they know about having a crystal ground. Sometimes I've seen questions where people seem to think that crystals are only a commodity item (and with the rise of digital circuitry, there is a bigger selection of out of the catalog frequencies, far bigger a selection than in the days when there wasn't much standard beyond a 100KHz crystal), and they wonder who supplies the frequencies that aren't in the catalog.

Obviously WWII set a different standard, with all those surplus crystals after the fact that could either be directly used or ground a bit to frequency, but those weren't commodity components, they were leftovers from a war.

But generally, crystals have always been a custom ground thing. "Custom" may be misleading, because it implies away from common place, but the common place when it came to crystals was to have one specifically ground for the frequency.

Of course, it became common in ham circles when 2M FM came along, because suddenly one needed to be exactly on channel (rather than use something out of surplus that was close enough), so everyone had to deal with the crystal companies. But that faded as synthesizers came along.

So maybe most hams with knowledge of crystal grinding are either oldtimers (and I am amused that I can be an oldtimer at almost 47), or those building things because that's the only way to get certain frequencies. Since crystal control is no longer a requirement, be it legal (no more of that law that made US Novices use crystals to determine frequency), or technical (VFOs got good enough decades ago, and synthesizers took over somewhat fewer decades ago), non-builders have relatively little interaction with crystal manufacturers.

I have acquired a Helper MM901 modulation meter. It looks and appears to work OK. The book mentions but does not describe the necessary accessories, specifically the coax jumper cable to connect the unit-under-test. The book says it is of a specific length but doesn't go on to say what that length is. I've been using a 2 ft piece of coax and it appears to work. Anyone out there have any info? Nothing on BAMA and company is apparently out of business. Thanks much.

All true, but if I was working on a boatanchor I'd ask here first. I prefer to offer an opportunity to a fellow boatanchor lover than to just go buy new for such items.

Junkers abound, but it would hurt to just trash them. Two or three of them could become a pristine piece of equipment.

A fellow ham asked me to help him configure a Globe Linear Amp to his Kenwood TS-520 and antenna tuner. It appears to me that the Globe will not let receive signals pass back to the transceiver. This was proven in the shop while hooking up an antenna directly to the Kenwood then putting the linear in line and loosing the receive signal.

I posted a schematic of the Globe Linear on my web site at http://www.ppinyot.com/HomePage.htm. Click on the top most picture to expand the image. It does not appear to me that there is a return path for reception.

How would one accommodate this linear with a transceiver? Do I need two T/R relays to make this work?

Thanks in advance,
Paul.

Does the TS 520 have an input for a "receive antenna?"

I did this with my TenTec Paragon and a Gonset Amp.

I used one dow key relay with the common to the antenna. The receive position went to the "receive antenna" rca jack and the transmit went to the output of the amplifier.

You key the relay from the xcvr.

So in the transmit position the relay closes and output from the radio goes to the amplifier and to the antenna via the relay.

In the RX mode the signal comes from the antenna then into the relay and finally to the "receive antenna" jack on the radio.

Typically, you'll need two Dow-Key DK-60 series or similar coax relays.
You can also use one of the more expensive Dow-Key (Kilovac) dual
coaxial relays. If you need a diagram, I'll send it along to you.
Also, given the relative power levels, you can get away with one coax
relay and one other, RF "usable" SPDT relay. That may save you some
grief and money. Again, I have the info if you'd like it.

Paul, Looking at the Globe schematic, it appears there's no control circuitry within the amplifier, per se. The tubes are biased to cutoff in either Class B or C, depending on mode (SSB or CW). That's OK... The Kenwood T/R relay is not made to switch 115v AC line voltage inasmuch as one side of the T/R switch is grounded and because the relay contacts are not designed to handle two inductive loads (relay coils). What, then, will also be needed is an intermediary relay, to be keyed by the Kenwood. This int. relay will, in turn key the two actual changeover relays. It may sound a bit convoluted, but it'll work just fine. Parts should not be a problem and you can use the "box" for any future amplifiers! de K3HVG

If they truly work OK now, new tubes probably won't do a thing. The only tube that might be of some interest would be the first RF amplifier in the circuit and even that is only a remote possibility. When the opportunity arises, and you have access to a good tube tester, have a look at the tubes. Then you can make a value judgment as to what might help.

Neither of these radios could be called high performance,
and in fact represent the bottom of the barrel. Could new
tubes help? Possibly, but don't expect much. The best thing
to do is test the tubes on a reliable tester, and replace any
that are weak.

Recapping is a first step. You might achieve an increase in performance by checking all the resistors to see if any are more than 10% out of range (usually they age higher in value).
This will let the tubes operate closer to their intended ranges. Also a total alignment is recommended after recapping. Check out the S38 Guys website for other hints on that radio.
Lastly, make sure that you are using a good antenna. Mike KF6KXG

GREAT info, that's why I lurk here often.

Just one teensy question, though...is this polarized?,
e.g. the 200pf cap is the receiver probe, the inductor
plus shunt is the signal gen connection? or versa-vice?

Thanks,
Terry Bakowski

Pete, I remove temporary items from my web site pretty quickly due to space restrictions. I tried to e-mail the chart to you but got the following reply:

----- The following addresses had permanent fatal errors -----
<hpf@gainbroadband.com>
(reason: 591 your host [216.86.143.7] is blacklisted by bl.spamcop.net. No mail will be accepted)

No more midnight spam for me! Anyway, the chart is back up for a couple more days.

By the way, on the perfboard I used to build my dummy antenna I added a 0.1 uF coupling capacitor between the signal generator input and a second output lead with an alligator clip. This provides a 50-ohm DC-isolated signal for IF alignment. I usually align radio IFs by sweeping a signal at the front end, often just blasting through the RF and mixer stages at 455 kHz. But the alligator clip is handy when I want to drive the mixer grid directly. You can drive the grid with the dummy network, but the 50-ohm source impedance of the direct output ensures that the parallel impedance at the grid doesn't affect the sweep flatness.

Brian

AMERICA IN DANGER of its own out-of-control Bio-Terror:
Is 1984 here? Or cripping... God help us,
blinded!
Originally Secret Bio-Aerosols are misused to HARM and Torture in
U.S.A.

Our government needs TORTURE in U.S.? See details
below...
It has your VOTE, support? Abused...

CRITICS (political/social/cultural) are harassed and secretly
persecuted
along with their KIDS in schools/colleges, especially, during
tests/exams
(Think: Guantanamo "stress-positions" in the context of
1984-technologies)

Bio-Aerosols and aerosolized chemicals are used to cause:
- severe colds/coughs turning into bronchitis, eye irritation
- bacterial pneumonia/other pneumonia, shortness of breath
- surges of severe headaches, migraines, dizziness, etc.
- fainting collapses by symptoms-mimicking aerosols
- severe stomach pains (sharp, burning, nausea, etc)
- chest-wall pains, heart-muscle inflammations/trauma, etc.
WORSE:
- heart attacks under cover of second-hand smocking
- car crashes/accidents by Vertigo-causing aerosols
- liver/organ failure by small-dose toxins (trace-less?)
- cancer-causing/facilitating - months-long assasinations
This "Yushchenko syndrom" CAN destabilize NATIONs
Waste, Fraud, Cronism and Abuse in HomeSec/FBI
Fabrication of Believable Info/Manufacturing of accidents

U.S. mail IS polluted in "anthrax-like" manner to HARM critics
Libraries, airplanes, hotels, offices, buses, trains - all polluted!

A network of Secret Gas-Aerosol Rooms operated in US
(in Philadelphia, Narberth, Lower Merion, PA)
(in Wilmington and Newark, DE)
(in Hampton, Williamsburg and Richmond, VA)
AND ELSEWHERE.... details below...
Bio-aerosols used to hurt and simulate panic attacks, etc.!
Soviets locked critics into nut-houses, now WE do the same!
Symptoms-mimicking aerosols do HARM, weak or ill people.

Say "Stop, I care" - call Senate (202) 224-3121
House of Representatives (202) 225-3121
What IS going on in America? *Print and
Post*
Manufacturing of FEAR to grab more Power and Money, of course.

Big Brother spins protection...
And fear is used to clamp.
Democracy needs action!
On which side do you stand?

Looked at this?!! Go to Google/Yahoo newsGroups:

TORTURE IN USA: Secret Aerosol Rooms

US Scientist needs legal help dealing with the secret aerosols rooms

and Williamsburg (VA) and other places. Highly volatile aerosols with
and without bacterial content cause dry cough, airways a...

Full text was at:
http://buyit.philly.com/findit/search/results.jsp?catId=krd_philenqda...

This was a new on-line ad placed in Philadelphia Inquirer and
Philadelphia Daily News on www.philly.com (see full text below)
It was about the secret aerosols rooms in US. One could find it by
searching "secret", say, in the ad section of philly.com.

Democracy can not function effectively without the informed public. As
a former NASA Langley scientist working in the area of nanotechnology
and nanoscale particles, I have been recently exposed to the
establishment of secret gas-aerosol rooms inside of United States, at
least in the Mid-Atlantic region (from Philadelphia to Virginia).
First, the highly irritant aerosols have surfaced at the NASA Langley
Research Center in several safety accidents. Investigations were
blocked, probably, because of lack of Congressional approval for such
financially-lucrative research at NASA. Later, these aerosols had been
encountered outside of NASA in Virginia, Delaware and Pennsylvania
.
This points out to yet another proliferation of originally-sensitive
technologies into domestic American life to hurt and harass people
without a proper oversight and much control. This amounts to torture,
extra-judicial prosecution and authoritarian intimidation tactics. The
use of such irritants and the operations of the secret gas-aerosol
rooms are gross violations of human and constitutional rights of
American citizens and various domestic and international laws.

----------Full text of an ad from Philadelphia's
philly.com----------
TORTURE IN USA: Secret Aerosol Rooms
US Scientist needs legal help dealing with the secret aerosols rooms
(SARs) operated illegally in Philadelphia area, Newark (DE), Hampton
and Williamsburg (VA). Highly volatile aerosols with and without

bacterial content cause dry cough, airways and eyes irritation, chest pain and inflammation. FBI and Homeland Security associates are likely operators of SARs, while collaborators may be hotel staff and landlords, who get financial/material or other incentives. US citizens and kids are victims.

Torture is any act by which severe pain, whether physical or psychological, is intentionally inflicted on a person as a means of intimidation, deterrence, revenge, punishment, sadism, or information gathering. At times, medicine and medical practitioners have been drawn into the ranks of torturers, either to judge what victims can endure, to apply treatments which will enhance torture, or as torturers in their own right. http://en.wikipedia.org/wiki/Torture

America in Danger!

America in danger -
The vice is NOT impeached.
America in danger -
The public trust is breached.

Big Brother spins protection
And fear is used to clamp.
Democracy needs action!
On which side do you stand?

Which side are you on, boys?
Which side moves you on?
Which side are you on, girls?
Which side did you wrong?
(Chorus after F. Reece)

Your church is burned by haters.
The priests to go to jail?
Your dreams are cheyned by traitors,
But hope still shines through veil.

Dust rooms came back to gas us
With neo-Naz (or Con) embrace...
New immigrants do make US!
And not the SSuper-race...

***

The Government of Torture

Our government needs TORTURE?!
It has your VOTE, and, now, support?
But peace (not vice) needs steady nurture
And trustful words of calm rapport.

Beware of loud, but FALSE, ideas
That flame a thirsty hellish torch.

Protect the old and true ideals
And Constitution's civic urge.

Yes, torture IS a hellish torch -
In bloody hands, a blinded sword,
With Constitution used to forge
All laws on rights as mere absurd!

Remember victim's silent cry
And SEE the Christ in all of us.
Don't let your government to spy
And torture with some bio-dust.

I have some sounders which are only good for parts, post a picture of what
you have and I will try to help you find parts needed.

If you are interested in landline telegraph, check out

Source record: 11163

Don't waste your money buying all new tubes -- even as spares.

When I bought my second Hallicrafters SX-28, it included a box with three to four sets of new replacement tubes. The original owner had stashed them away in case of need. He only used a couple over the years, then sold the rig. The second owner hadn't used any, or perhaps one or two. Even if I ran this radio 24 hours a day, I doubt I could use up all these spares any time soon.

Your radios use common tubes that are cheap and readily available. I don't think there's any point in hoarding spares now.

Regarding performance, I second the advice about doing an alignment and using a good (i.e., long) antenna.

Sounds like a "KOB" Key on Board configuration - fairly common - but
collectors do watch some manufacturers or the "history of where used" (e.g.
specific railroad, RR location, Western Union)

Tom Perera, W1TP has an extensive web site that you should consult.
TELEGRAPH & SCIENTIFIC INSTRUMENT MUSEUM
http://www.chss.montclair.edu/~pererat/telegraph.html

Tom provides historical references for historians, writers, screenwriters
and movie/television production companies)

Here is photo of a beautiful Bunnell KOB

AMERICA IN DANGER of its own out-of-control Bio-Terror:
Is 1984 here? Or cripping... God help us,
blinded!
Originally Secret Bio-Aerosols are misused to HARM and Torture in U.S.A.

Our government needs TORTURE in U.S.? See details below...
It has your VOTE, support? Abused...

CRITICS (political/social/cultural) are harassed and secretly persecuted
along with their KIDS in schools/colleges, especially, during tests/exams
(Think: Guantanamo "stress-positions" in the context of 1984-technologies)

Bio-Aerosols and aerosolized chemicals are used to cause:
- severe colds/coughs turning into bronchitis, eye irritation
- bacterial pneumonia/other pneumonia, shortness of breath
- surges of severe headaches, migraines, dizziness, etc.
- fainting collapses by symptoms-mimicking aerosols
- severe stomach pains (sharp, burning, nausea, etc)
- chest-wall pains, heart-muscle inflammations/trauma, etc.
WORSE:
- heart attacks under cover of second-hand smocking
- car crashes/accidents by Vertigo-causing aerosols
- liver/organ failure by small-dose toxins (trace-less?)
- cancer-causing/facilitating - months-long assasinations
This "Yushchenko syndrom" CAN destabilize NATIONs
Waste, Fraud, Cronism and Abuse in HomeSec/FBI
Fabrication of Believable Info/Manufacturing of accidents

U.S. mail IS polluted in "anthrax-like" manner to HARM critics
Libraries, airplanes, hotels, offices, buses, trains - all polluted!

A network of Secret Gas-Aerosol Rooms operated in US
(in Philadelphia, Narberth, Lower Merion, PA)
(in Wilmington and Newark, DE)
(in Hampton, Williamsburg and Richmond, VA)
AND ELSEWHERE.... details below...
Bio-aerosols used to hurt and simulate panic attacks, etc.!
Soviets locked critics into nut-houses, now WE do the same!
Symptoms-mimicking aerosols do HARM, weak or ill people.

Say "Stop, I care" - call Senate (202) 224-3121
House of Representatives (202) 225-3121
What IS going on in America? *Print and
Post*
Manufacturing of FEAR to grab more Power and Money, of course.

Big Brother spins protection...

Looked at this?!! Go to Google/Yahoo newsGroups:

TORTURE IN USA: Secret Aerosol Rooms

US Scientist needs legal help dealing with the secret aerosols rooms
(SARs) operated illegally in Philadelphia area, Newark (DE), Hampton
and Williamsburg (VA) and other places. Highly volatile aerosols with
and without bacterial content cause dry cough, airways a...

Full text was at:
http://buyit.philly.com/findit/search/results.jsp?catId=krd_philenqda...

This was a new on-line ad placed in Philadelphia Inquirer and
Philadelphia Daily News on www.philly.com (see full text below)
It was about the secret aerosols rooms in US. One could find it by
searching "secret", say, in the ad section of philly.com.

Democracy can not function effectively without the informed public. As
a former NASA Langley scientist working in the area of nanotechnology
and nanoscale particles, I have been recently exposed to the
establishment of secret gas-aerosol rooms inside of United States, at
least in the Mid-Atlantic region (from Philadelphia to Virginia).
First, the highly irritant aerosols have surfaced at the NASA Langley
Research Center in several safety accidents. Investigations were
blocked, probably, because of lack of Congressional approval for such
financially-lucrative research at NASA. Later, these aerosols had been
encountered outside of NASA in Virginia, Delaware and Pennsylvania
.
This points out to yet another proliferation of originally-sensitive
technologies into domestic American life to hurt and harass people
without a proper oversight and much control. This amounts to torture,
extra-judicial prosecution and authoritarian intimidation tactics. The
use of such irritants and the operations of the secret gas-aerosol

rooms are gross violations of human and constitutional rights of American citizens and various domestic and international laws.

------------------Full text of an ad from Philadelphia's philly.com-------------------------
TORTURE IN USA: Secret Aerosol Rooms
US Scientist needs legal help dealing with the secret aerosols rooms (SARs) operated illegally in Philadelphia area, Newark (DE), Hampton and Williamsburg (VA). Highly volatile aerosols with and without bacterial content cause dry cough, airways and eyes irritation, chest pain and inflammation. FBI and Homeland Security associates are likely operators of SARs, while collaborators may be hotel staff and landlords, who get financial/material or other incentives. US citizens and kids are victims.

Torture is any act by which severe pain, whether physical or psychological, is intentionally inflicted on a person as a means of intimidation, deterrence, revenge, punishment, sadism, or information gathering. At times, medicine and medical practitioners have been drawn into the ranks of torturers, either to judge what victims can endure, to apply treatments which will enhance torture, or as torturers in their own right. http://en.wikipedia.org/wiki/Torture

America in Danger!

America in danger -
The vice is NOT impeached.
America in danger -
The public trust is breached.

Big Brother spins protection
And fear is used to clamp.
Democracy needs action!
On which side do you stand?

Which side are you on, boys?
Which side moves you on?
Which side are you on, girls?
Which side did you wrong?
(Chorus after F. Reece)

Your church is burned by haters.
The priests to go to jail?
Your dreams are cheyned by traitors,
But hope still shines through veil.

Dust rooms came back to gas us
With neo-Naz (or Con) embrace...
New immigrants do make US!
And not the SSuper-race...

***

The Government of Torture

Our government needs TORTURE?!
It has your VOTE, and, now, support?
But peace (not vice) needs steady nurture
And trustful words of calm rapport.

Beware of loud, but FALSE, ideas
That flame a thirsty hellish torch.
Protect the old and true ideals
And Constitution's civic urge.

Yes, torture IS a hellish torch -
In bloody hands, a blinded sword,
With Constitution used to forge
All laws on rights as mere absurd!

Remember victim's silent cry
And SEE the Christ in all of us.
Don't let your government to spy
And torture with some bio-dust.

There is NO good use for evil torture!
No matter how the need is spinned
By Nixon's men, as bloody sergeants,
While truth is painfully re-skinned.

Not all of them were used by the RR or WU. Telco Toll centers used
telegraph to communicate when the voice circuits were too valuable to be
used by testers. This was true into the 50s. In addition, they were used
at the telegraph testboards as audible testing devices on teletype and
control signal channels. My sounder came from the Eugene, OR Toll office.
A fellow "Transmissionman" sent it to me as a remembrance when the office
testing was remoted to Portland.

This is true. In Chicago, Western Union and AT&T had large facilities
behind the Chicago Board of Trade to handle incoming agricultural commodity
(corn and wheat for example) trades and prices -- which were first send out
on landline telegraph and then eventually migrating to other transmission
methods. Some collectors picked up some of these telegraph items
(repeaters, sounders, mechanical automation) - due to usage and some went to
the CBOT museum.

Source record: 11176

I have two nice Collins 516F-2 Power Supplies for sale. Neither one has a
case.
Both have good cables and work.
1. SN 2623. This one is all original except the power cord has been
replaced. It has the original caps. $250;
2. SN 19717. This one has been completely recapped and has had a raised
ceremic tube sockett installed for the 5R4 tube. It also has had a choke
replaced with a non factory type. It looks good and works fine, but is a
different style. I think Bud Whitney, K7RMT still has some of the factory
replacement chokes if one wanted to make it completely original. I can send
pictures. Price is $275.
Shipping is extra on both power supplies.
Thanks, Charlie Hugg, K5MBX, CCA #307

Make sure you can't make one, cheaper, by buying a whole bunch of 2
watt carbon resistors and solder them up in series parallel. I've done
this a bunch of times. For 50 watts, that is 25 two watters. For a 100
watts, that's 50 2 watters. You can put a high power amp into that for a
few seconds if you need to.

I have the following original (not photo copy) manual for sale:

TM-11-4001 War Department Technical Manual
Repair Instructions for BC-312 (various models) and BC-342 (various models)
War Department, February 1945

The manual includes a description of operation, repair and alignment procedures, troubleshooting procedures, schematic diagrams, assembly pictorials, and material list.

There are some light pencil marking on a few of the pages but otherwise the manual is in very good condition. The price for the manual is $30.00, I will pay shipping to US or Canada.

I also have a complete tube set for the BC-342 (removed from a working unit), the main tuning capacitor assembly (consists of a four section variable capacitor, each 13-226pF), and various other variable capacitors with values of 3-25, 4-50, 4-75, and 6-100pF. One additional item is the front dial plates consisting of two circular plates marked with frequencies and bands, from the BC-342. If you are interested in any of these hardware items please let me know and I will give a better description or I can send you some pictures.

I am selling my NAB (National Assn of Broadcasters) Engineering Handbook (7th edition dated 1985). It is in a heavy hard cover, and the pages are slightly less than 3" thick. Over a thousand pages of text, photos and graphs for AM, FM, and TV stations. Although about 20 years old, it covers current day practices of analog broadcasters (digital HD is not covered). These come out about every decade.

The current edition (9th) goes for $329.00 at Amazon.com.

You can find it on EBay; started at $55 with a buy-it-now of $100.

These are Bell System or Western Electric parts. Pretty much any tool or part made for the Bell System had a KS number. Here's a web site that explains it:
http://www.ablepanasonic.com/telter.html

"Bell's actual hardware items (jacks, adapters, transformers, etc.) often carried a KS designation. KS stood for Kearney System, a parts numbering scheme developed for a Western Electric factory in Kearney, NJ. Even today, some common pieces of telecom hardware are marked with KS numbers. You might also find pieces of telecom gear with a ComCode, another Bell/Western Electric part number scheme. One 50-cent part can have a dozen different identifiers."

3343. Collins to Peoria

3344. Heathkit SB-401 LMO Experts?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-13 03:52:13 UTC
From: sargent <MAILFRMPA@AOL.COM>
Message-ID: <1158119533.036056.281500@p79g2000cwp.googlegroups.com>
Source record: 11094

I am working on the dial drive for this rig. The LMO is a TRW 800 651.

In setting the dial pointer to track across the 0-5 dial window, I have found that the LMO only makes (4) 360 deg rotations, not 5, as called out in the instructions. There are a series of 6 little "L" shaped pawls on the LMO shaft. On rotation (1), the inner-most pawl is stopped by a roll pin on the shaft bracket, but on rotation (2) it appears that (3) of the pawls are stopped by the first pawl. There after, one pawl is stopped by the preceeding pawl on each rotation.

None of the pawls seems to be distorted or bent in such a way as to interfer with the rest passing over it as they should.

This description will probably make sense to an expert- I suppose not to anyone else!

Anybody incounter this before??

3346. Should I paint tube shields black?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-13 10:38:00 UTC
From: SpamHog <n1jpr@hotmail.com>
Message-ID: <1158143880.488248.69930@e63g2000cwd.googlegroups.com>
Source record: 11096

I remember reading about very substantial increases in lifetime for
tubes shrouded in black, heat-radiating shields.

I have an early series R-390A, I don't care about keeping it pristine,
and I want to introduce all the official service mods, + a few more
aimed at improving reliability.

Its tube shields are all unpainted. I am tempted to paint them black,
using engine type heat resistant paint, but there are some unknowns.

- Are "proper" black shields so due to black-anodization treatment or a
paint layer?
Are they blackened BOTH inside and outside?

- Is engine paint appropriate?
(Most types are said to improve heat radiation).

- Should one paint shields both outside and inside sauf the electrical
contact area?
(I could e.g theorize that on the inside all transmission is by direct
heat transfer through glass-metal and air-metal contact, not going to
improve with a paint layer).
Are "proper" shields blackened both inside and outside?

- Would the same reasoning hold for at least the _top_ dustcover of a
radio?

To do a proper job I should first check for temperature changes at the
tube surface in the bare/bare, bare inside / painted outside, and
painted/painted cases, but I am sure there is some knowledge floating
around about this, enough to skip the experimental bit.

Hints, o brethren?

This sounds much like the hardware that limits rotation on an R-390 or
R-390A Kilocycles knob to 10 (or is it 11?) turns, and which also is
subject to similar troubles.

With the LMO at one end of travel, so that all the pawls are free to
move, can you move them by hand to see what is causing them to hang
up when they shouldn't? If they're just gummed together by thickened
lubricant, it might be a fairly simple job (Ha!) to put a few frops
of carefully-chosen solvent on them and free them up.

> Hints, o brethren?

I _think_ I remember that the black is from anodizing, but I Could Be
Wrong.

The best tube shields are the IERC shields with the inner contact
fingers to maximize heat transmission from the envelope to the shield.

I Seem To Recall that The Fine Manual for the 390 and the 390A says to
run with the dustcovers off where possible. Yep, I was right. In
The Field and Depot Maintenance Technical Manual, TM_11-5820-358-35, I
find this:

4. Checking Unpacked Equipment
...
e. Remove the top and bottom dust covers by
removing the 16 screws (TM 11-5820-358-10) and
lockwashers that secure the covers to the main frame.
f. Inspect the subchassis on the upper and lower
decks of the receiver for' loose connectors, loose tube
shields, and broken tubes as follows:
...
(2) If the receiver is to be used in a fixed
installation, remove the shields from all
tubes (fig. 2 and 3) except V201 through
V206, V505, and V701.
(3) Unless extremely dusty conditions are
expected, do not replace the dust covers.
(4) Do not replace the dust covers if the
receiver is to be installed in Cabinet CY-
979/URR or Cabinet CY-917/URR.

So you may be able to save a fair amount on tube shields. A fan to cool the rig down also is A Very Good Idea. My humble opinion is that the bottom side of the 390A needs the fan more than the top does, as the heat tends to rise and get trapped underneath.

Source record: 11099

Although the finned heat shields are excellent at moving heat away from a particular tube, they do not remove the heat from the cabinet. Heat still remains in the cabinet. The best long term solution is to remove the heat from the cabinet. Often, this involves a fan running at reduced speed (for the sake of noise). Some of the modern small computer fans would do wonders.

That may require cutting holes in cabinets. Some people are not willing to do that. Little things can help. Reducing the line voltage fron 122 volts to 110 or 115 will reduce heat a bit.. Even a cabinet that encourages natural convection flow will help.

Regarding the tube shields themselves, shiny material causes the heat to be reflected back to the tube. So, black inside and outside can help - even if painted. Having the black finned material between the shield and the tube can help.

You can purchase an infrared heat sensor and measure the temperature of the tubes. Also measuring the temperature of the case will tell you if you are making progress.

I have found that reducing the internal temperature of equipment that tends to run warm has greatly increased the reliability and reduced tube replacement to a minimum.

The A number 1 thing to do to reduce the heat in a R390/390A is to turn off the
ovens.

Yes, that mechanism is called a Geneva wheel. and it's most likely that either the first or last "washer", is locking up and not rotating due to grease congealing and either locking it to the front or back plate or to another wheel and 2 rotating at a time.

I have a couple of those LMO's if all else fails, but expect that as the other poster suggests, a drop of WD-40 would cure your problem.

Well, actually, no it isn't a Geneva wheel, but it performs the same purpose. A Geneva wheel, actually called a Geneva Stop Work, is a Maltese cross shaped wheel that is used in conjunction with a rotating pawl. As the pawl rotates, it flips the Maltese cross shaped wheel one tooth per revolution. The final tooth on the Maltese cross is oversized, and will block the shaft from turning when it is reached. The cross can have more than 4 petals.

and it's most likely that

>I would bet you are right about that!

WD-40 will loosen up the old grease, but after a while it will evaporate
and just congeal again. I recommend first using WD-40 or something similar
to get the old gunk out, and maybe a naptha soak if you want to pull it
apart. Get all of that out, then try something like Permatex Superlube
spray to get some new lubricant in there.

WD-40 is a great solvent and water dispersal agent, but it's a lousy
lubricant and it eventually evaporates and leaves gummy varnish behind.

> Often, this involves a fan running at reduced speed

Try wiring two "whisper" fans in series. Even quieter than a whisper :-)

Common sense tells me that anything which moves air over the chassis will be much more effective than some marginal change in the covering of tube shields.

Biting the bullet, and with a cup of coffee and a fresh cigar, I first examined the free motion of each pawl. Last night, with a needle point oiler, I had put a little thin oil on the pawls to soften up any old grease. They all turned freely except the same two as before; these I could not get to rotate seperately, even applying light pressure in opposite directions. Therefore I removed the brass bushing holding the washers in a stack on the drive shaft, and carefully removed the stack of (6) pawls. The two that were stuck were REALLY stuck together, but I was able to slide them apart between my thumb and index finger. There was no corrosion between them, just dried grease. The ball bearing race was also dry, so I cleaned it out, and relubed them with HO railroad gear grease. Incidently, each of the (6) pawls is identical, so keeping them properly stacked was not important. The only thing is that the outer most must be engaged via a roll pin in the brass bushing when reassembled. Ok, now I lost my train of thought, and ran the drive with a screw driver to work in the new grease. MISTAKE! I forgot to note whether the variable capacitor driven by all this was at min capacitance or max capitance when the shaft was in the full counter-clockwise position. So what is you best guess? Should I try MIN or MAX capacitance for the fully counter-clockwise rotation(lowest frequency)? I can change it later if wrong, but I would like to save all the disassembly and reassembly if I can.

Thank you guys!

Colin:
> Heat still remains in the cabinet.

True.I find rather amazing how many old design types, esp. for consumer tube gear, were oblivious to heat. I think ppl had a "machinery" or "engine" paradigm in mind. If stove and charcoal iron are hot, why not a radio?

WRT boatanchors, I always tried to improve ventilation, with a suspicion that in so doing I might move frequency-defining parts off the expected temperature range, but the '390 seems to me quite well temperature compensated. When Collins folks were designing this, bitter cold in Korea must have been a fresh memory.

Right now that radio is coverless, perched mid-air on a rack-on-wheels. I run a room fan aimed at it, and the difference in temperature is very remarkable. The previous owner, I2FZX (sk) used it for decades with covers on, sitting almost directly on a surface, with an HRO-500 right on top, and never had problems with it. Maybe the HRO did.

Longer term, I plan to put it in a desktop wooden cabinet, stacked with some SSB/synchro-AM device and a speaker (and a thermometer??), with plenty of forced airflow. I am considering flowing air from the bottom - out the lower side holes - into the upper side holes - out the top - sucked out the back by a bank of slowed-down, underfed 120mm fans. I also want to do the ss-rectifier mod, and introduce a NTC resistor for inrush current limiting, both of which will cut heat.

Back to the original question, I'll do some experiments with engine paint and a meat thermometer. If it's good for telling if meat is cooked, it may help avoid cooking tubes. :-)

I believe you are going to find the capacitor was at neither position,
but rather somewhere in the middle. They were looking for best linearity,
and that is never found near the ends of travel.

So what is you best guess? Should I try MIN
> or MAX capacitance for the fully counter-clockwise rotation(lowest
> frequency)? I can change it later if wrong, but I would like to save

What I would do, is power up the LMO, and adjust the capacitor to
the highest frequency, and then setup the stack for the correct
rotation direction. (which I don't recall). The LMO tunes 5.0-5.5 MHz,
though.

I went looking for LMO instructions, and found them first try using
google:

Heathkit LMO repair

The instructions are on the BAMA site.

Fully clockwise is MAX capacity. (Min Frequency)

W4ZCB

I checked the BAMA note, and every place else I could find, without result. BAMA has a schematic of the solid state (a la 303 and 102 rigs) LMO, but no hints such as I am seeking. Neither my '301 rcvr nor '102 vxcr uses the same part number LMO, but I guess I can look inside to see for a comparison of the variable cap position.. So far as being set somewhere in mid-value of the variable cap, that may be true. I'll lock down the tuning bits and give it (5) rotations- that will tell me if STOP to STOP on the dial is equal to full rotation of the cap. Thanks for your suggestions.

There are set screw marks, The problem is knowing if they are from FULL rotation, or one revolution of the shaft less.

The two LMO's are mechanically equal to each other, they are based on a design by Joe Shafer. If you open up the can, you will find a worm drive coupled to the tuning capacitor. That worm drive and cap are certain to need cleaning and regreasing, by the way.

Follow the setup directions for the SB102's LMO, and you will do just fine... I think.

Sex? I didn't see any reference to sex. I did, however, look at your "blog," etc., and found the answer to my question.

You are not only a moron, but possibly a dangerous psychotic one.

You are going into the "delete without reading" filter.

And others don't like homophiles who walk around with a chip on their shoulder and get in everyone's face with their sexual preferences.

Homophilia is the other face of homophobia, and it appears that you suffer from the former malady. Stop looking at everyone else through the prism of your own sexual tension, and stop projecting your fears upon those who are different from you.

Your untrue and fearful cries of "homophobe" are a way of absolving yourself from any responsibility for your own life situation. It is the same thing that blacks do when they overuse the term of "racist," and most of us can see right through that kind of rhetoric no matter who uses it.

You, sir, are playing the blame game, but it doesn't work any longer. It's been worn out long ago. Come up with something real, or else continue to remain a newsgroup fool.

This listing (ebay # 12003035856) is in violation of Federal laws..
Nobody ever built a ten meter amplifier with 5 watts input.This is CB
Radio Amp.100% .. If you guys MUST practice this "BOOTLEGGING" please
leave Ham Radio out of it ..You are using Ham Radio to try and justify
your illegal activity and I resent it.. HAMS, WE MUST START POLICING
OUR RADIO ACTIVITES OR LOOSE OUR PRIVILEGES,, Then we would have to
BOOTLEG, Heaven forbid..W4PQW since 1948

About ten years ago I was using a Johnson Messenger 10 Meter transceiver in the 10-M AM window, crystaled for 29.030MHz. I had a heck of a time (before eBay) trying to find an old amp to use with the radio. I ended up building my own sweep tube amp from a schematic I got years ago at AES in Milwaukee.

So, yes... I built an amp with 5-watt rated input for use on the 10M amateur band. ....and, it worked well. A pair of sweeptubes in grounded grid with a 6AQ5 keying tube.

BTW, back in 1971 anyone could walk into Amateur Electronic Supply, walk up to the counter and get a copy of the plans/schematic for the amp I built. The sales guys would then direct you to the parts bins to get the necessary parts to build it. All the hams in Milwaukee knew what was going on there. AES made a killing in the CB trade for decades.

Just some random thoughts on CB amps.

Pat WB9GKZ since 1971

So what is your point?

Hams can convert anything they want to convert as long as they do so within
their license limits. 10 meters is.

Don

3387. Radio Books for Sale - ARRL, RCA, Surplus, Antennas and More

Newsgroup: rec.radio.amateur.boatanchors

From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <kaHOg.6409$B14.3898@dukeread03>
Source record: 11139

FS: AS NEW Icom IC-720A HF transceiver. This transceiver is as new, used a very few hours and stored. There is not a mark on it. Comes with Power Cord, copy of the manual, and Icom IC-HM-7 mic.
This radio works, but the volumn control is scratchy and the Band Switch/Relays need cleaning.
I have to rotate through the bands a couple of times to get it to work right on each band.
There can not be any wear. It has to be a cleaning problem. Price is $275 plus shipping from 79602
I can send digital picture upon request.
Thanks, Charlie Hugg, K5MBX

3390. FS Drake MN-2700 and B-1000 Tuner

Newsgroup: rec.radio.amateur.boatanchors

FS Nice Drake MN-2700 Antenna Tuner. It is the high power version and this one has the Drake B-1000 Balun installed. It has the sticky cabinet, but it is in nice shape. I also have the original shipping carton and the original Drake Quality Control Tag dated March 29, 1979. This tuner has been store for over 20 years and has seen little use. It works great. Price is $575 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

And we ought to be out there when we are driving to work, school, errands
recording the activity of the unlicensed truckers who bootleg on 10 meters,
too. Riley still is interested in lettering these companies.

Are they? They can stop off at the truck stop in Breezewood PA, where there is a huge billboard exhorting you to stop off at their CB shop "when you are ready for a BIG radio." And there's the guy at the CB shop on rt. 95 out of Richmond with a tape loop that comes on the air every fifteen minutes advertising their services... I can hear their third harmonic down here nearly a hundred miles away.

I can't believe that the FCC cares about any rules enforcement at all any more. They're too busy worrying about obscenity on television to bother actually doing anything about actual misuse or technical standards.

A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.soldersmoke.com

Listen at: http://www.soldersmoke.com

SolderSmoke #32 (September 16, 2006) is now available
on http://www.soldersmoke.com

Topics covered in #32:

-- HW-101 FT101 Hybrid Rigs.
-- BNC and RCA phono connectors.
-- Changing the clutch and oil on an HW-101.
-- Third order intercept rules of thumb.
-- Modular circuit boards.
-- Babbage difference engine.
-- Hardware to crack enigma.
-- Bills video of his DSB rig.
-- MAILBAG: KC2IGJ, G4GOY, WL7M, D. Gaskill, Gary
Beach

Tired of listening to Led Zepplin or NPR on your
I-Pod? Wouldn't you like to be able to carry with
you the kinds of ham radio conversations that you
listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in
London, England meet regularly on the ECHOLINK system
to discuss their homebrew radio projects. We are
making them available as PODCASTS.

RSS FEED: You can subscribe to the program, have
them downloaded to your MP-3 player, and listen to
them at your convenience. To subscribe, just cut and
paste this URL into your I-poder (or similar)
software.
http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the
site below and listen to the latest program (and
earlier editions) using the audio software on your
computer.

http://www.soldersmoke.com

All our programs are available here.

We hope you enjoy the program. Please send us feedback.

My suggestion: get speaker transformers for 70V distributed PA systems and
run them in reverse. Your local installed sound place will probably give
you a bunch of scrapped ones for free.

And if not, then they're not at all expensive new, whether from Radio
Shack or a full-service electronics shop. They tend to be 600 Ohms to
16/8/4 (and a slew more) Ohms. If you're in the UK, Maplins may have
them, or one of your mail order houses. Here in the US, I get mine
from Radio Shack locally, though Mouser, Allied, and Jameco also carry
them via mail order, and Cinergy (formerly Radio Supply) in Oklahoma
City sells them, too.

Bill included rec.radio.amateur.misc in the list of newsgroups he posted the original message to. Since rram seems to be reserved for flames, discussion of amateur radio is evidently off-topic.

Oh ,I see, the Professor is selling (partly illegal)CB Power amplifiers.
Probably no solder smoke on his premises ......just carton boxes filled
with equipment ,ready for shipment to truckers' watering holes.

Bill , I enjoy listening to your podcasts ....keep up the good work.
Just ignore the above junk seller ,who apparently is NOT capable to
produce any civilised and intelligent response.

Frank GM0CSZ / KN6WH

An ordinary filament transformer with a 120 volt primary and 12.6 volt secondary will work well. The turns ratio is about 10 to 1 and that yields an impedance ratio of 100 to 1. That will match a 600-ohm output to a 6-ohm load and will provide a decent match to an 8-ohm or 4-ohm speaker. A small 1 amp. transformer is sufficient. --Ed

And in the days of when boatanchors roamed the earth, one guy suggested
in a magazine article that this was a good way to use up all thos
400Hz transformers that most ended up with a stock of via surplus,
but which weren't too useful for power applications, since few
had a source of 400Hz power.

I guess the trick today is to find a piece of consumer electronics
in the garbage (so long as it doesn't use a switching supply) and
use the power transformer from that. Filament transformers are
as likely hard to come by as audio transformers these days. (Not
that either is really that hard to get, but if one doesn't have a
handy audio output transformer, they are likely to not have any
filament transformers handy.)

Michael

Every on-topic post helps rram, even if only a little bit. Keep these
posts up. I added soldersmoke to my bashpodder list, and will be
listening to the podcast to see what it's all about. Number 32 sounds
very interesting so far.

3424. HW-101 mods for 17 and 30 meters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-17 21:54:32 UTC
From: Rocketeer <cscholl@izzy.net>
Message-ID: <1158530072.859813.150990@d34g2000cwd.googlegroups.com>
Source record: 11074

Hello the Group!

I have an Heathkit HW-101 that operates well on 80/75/40/20 and is useless on 15/10 meters because of all the higher frequency junk in this area. The Area is Ann Arbor/Ypsilanti near the WAAM antenna group.

I want to sacrifice the 15 meter and one of the 10 meter positions for the 30 and 17 meter bands. From what I can see on the diagrams and the crystals being used, I think all I would need are crystals in the proper cans at the frequencies 18.895 for the 30 mter range and 26.896 for the 17 meter range.

I realize that just changing out the crystals may not be all that is needed, however, this is the first step. Any Heathkit resources out there?

Curtis Scholl

Note that the frequency response may be deficient... then again, it might also be great. Those Western Electric wall warts that were used for princess phones used to be flat from 50C-10KC easily and I saw more than one broadcast station that used them as improvised audio transformers. On the other hand if you buy a modern Talema toroid from Digi-Key you'll find the response drops off dramatically above 100C or so... which is great for keeping power line trash out of power supplies but not so good for audio.

If you don't know, run a 1 KC square wave through it with the loading you intend to use and watch the output on a scope. The calibration output on a Tek scope is just fine for the application.

Scott, Mike, Michael and Ed... Thanks so much for all the G R E A T suggestions!! I really appreciate you guys taking the time to help me out. I've consolidated my 5 boatanchor receivers into a station control that selects an 'ol R-42 speaker in the shack (500, 600 or 5000 ohms) and a more modern 4 ohmer outside the shack in the workshop and with a toggle I can listen while I am a-whittlin;----well I have noticed that the menagerie of output impedances makes the R-42 BOOM IN while listing on an SX-42 but switch to my SX-146 and it just doesn't have the same horsepower. The reverse is true on in the workshop on the modernly 4 ohm speaker. So I decided the easiest thing to do is hitch up some sort of impedance transformer and bring all the receivers into commonality . THANKS FELLERS---you made my day.

73 Smokey

That may be true for tubes that run really hot, but most of the tubes
in a R-390A are running at modest power levels, except maybe for the
rectifier tubes and the audio output tubes. They're all running at
well under 100 degrees C, cool enough to touch. That's many many
multiples of 10 degrees C away from their limit.

So I wouldnt worry about it.

Sez you, you smarmy, liar. One of the posts I sent to the FCC was from the
guy who makes the units, claiming they were for CB.

By the way, This "newbie" got his first ham license in 1952, and his first
Commercial License in 1955.

3441. gooped up BRPE tape punches

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-18 21:00:45 UTC
From: Ancient_Hacker <grg2@comcast.net>
Message-ID: <1158613245.675178.93120@i42g2000cwa.googlegroups.com>
Source record: 11091

I have two mostly complete BRPE tape punches. You know, the old ones rated to go somewhare arounf 100 CPS.

Problem is they've been sitting for a few decades and all the mechanical parts are all stuck with Aunt Jemima's tty Oil and Pancake Syrup it seems. There's no way the little levers are going to flick at 100 cps! Can barely flick them by finger in about a second.

I've tried squirting various solvents into the rats nest-o-levers. Helped a lot but several are still very sluggish.

I'd dip it all in TCE but I don't think the solenoids would like that.

Unles anybody has some ideas, I'm going to rig a little aquarium pump to trickle solvent through the maze-o-levers for a week or so or until the levers loosen up. Then again, the solvent might dissolve the pump and tubing so I end up with plastic glop all over the critical parts.

Any ideas appreciated.

And, it appears not to comply with several specific FCC regulations:

- It has gain through the CB frequencies (violates 97.317 (b)) and is thus not eligible for certification, which is required for amps operating below 144 MHz. The FCC may be about to relax or eliminate the 97.317 rules about external amps operating in this frequency range, but for the moment this reg is still part of the law.

- Its second- and third-harmonic distortion levels are roughly 10 dB too high to meet the -43 dBc requirement (violates 97.307 (d)).

Top posting. One solvent that does not bother solenoids, and is an
excellent cleaner is transmission fluid. It does not bother rubber tubing
either, and is not very expensive. I do remember tape punches, and wish
you pleasure with yours.

One irradiated spray bottle full of it, from your local hardware store and
auto parts store should suffice.

Jim

I'd suggest PB Blaster. It's a good penetrating oil, it will get in
between everything and at least have some solvent action. Hit it with
the PB blaster, cover it, leave it for a couple days, then start trying
to flush gunk out with naptha.

Consider using something like a high-grade turbine oil so that it doesn't
gum up so easily next time. The Zoom-Spout oil from Ace Hardware is fine,
and about equivalent to Castrol OC-11. Another good choice is the Royal
Purple Synfilm 32, which is a much stronger solvent than typical petroleum
oils of the same viscosity and is my first pick on old gear that may have
residual glop left in there.

NOT PB BLASTER !!!!

I love that stuff for breaking up rust .

But right on the can is a description of how well it melts a styrofoam cup.

It will melt rubber and plastic.

D O N O T U S E P. B. B L A S T E R for this project - you
will be sorry!

Yes, it WILL melt rubber and plastic, very strongly. Be careful with it.
It's okay on some phenolic plastics, but styrenes and vinyls are very
quickly destroyed. And it may not even be okay on all phenolics so test
first.

This is not a reason not to use it, it's just a reason to be VERY CAREFUL
when you use it.

Max Gain Systems only ever did the US Racal RA6790/GM spares Harold.

Telford in the UK may still have a few from the batch they had manufactured; but won't sell them, at least they wouldn't when I asked about two years ago.

I have converted an RA1792 and an MA1723 Tx exciter to LED displays, it only took about a week, but at least you can read them, and in the dark as well! I started to do a web page on this experience but got stuck with the html part...

The winged emblem was replaced by the round emblem in the early
1960s.

The round (meatball) emblem came out came out in the 70's and replaced the traditional "winged" emblem. Certain production changes, some quite significant, accompanied the change in the Collins logo. Thus, when buying or selling, the round emblem connotes later production equipment......

Which is really why someone cares about the emblem. They want one
specific to the era of production, and the emblem is an easy way
of denoting them. All those ads seeking Collins equipment with a specific
emblem aren't there because the people think one emblem is nicer looking
than the other.

Running more than 4 watts on 27 MHz in the US has been illegal since
CB became legal here - 1961 IIRC. I don't know what the rules are in
Oz.

The most significant difference is in the KWM-2 transceiver.
The round-emblem type, which appeared around 1969,
used two plug-in relays for T/R switching, whereas the earlier
winged-emblem KWM-2 used telephone style relays.
If a old-style relay fails, it can be a major
headache trying to wire in the replacement.

The very newest KWM-2 and KWM-2A's used teflon wiring instead of vinyl
insulation. The vinyl insulation is easy to scorch
if your soldering skills aren't first-rate.

73,
Ed Knobloch

It's easy to scorch even if your soldering skills *are* first-rate.

It's that layered turret construction that makes things difficult.

I have had numerous winged KWM2A's that were teflon wired, and had
the full set of upgrades, as shown in the KWM2 update sheets.

As far as I can tell, the obsession with the meatball is simply because
it is the newest example of very old technology.

Al, yes more or less the same rules in Oz - type approval etc, but this gear is not considered as a collectable boatanchor though, so a bit off topic in the boatanchors forum - maybe an excess of cross-posting.

Actually it was 1957 when they took the 11 meter band from the HAMS and
created the "Class-D" Citizens radio service....The callsigns
were 11W1234 series of calls.
If this guy wanted to market these amplifiers and not attract the wrong
attention all he would have to say is they are for amateur use only, with
broadband coverage from 28 to 30Mhz.HAM gear does NOT require ANY "type
acceptance" at all..
It's not real hard to figure that they would indeed work on 21/24 and
27Mhz....food for thought....

My fault for not noticing your ng. I guess *newer* amps wouldn't be
too collectable, although I do recall an article in QST (or was it CQ)
many years back about a pair of 4CW300s running in the trunk (boot) of
a car. That kind of amp would probably be considered pretty
collectable.

The TU-7-B sounds like the series of tuners for the BC-191/375 Signal Corps/AAF transmitters. The range for this tuner is 4500kHz-6200kHz. I didn't know that RCA made them... unless, of course, we're talking about an entirely different TU-7-B. If there is a tuning chart on the front panel that delineates the above frequency range and a row of what look like banana jacks on the rear panel, then it probably is for the 191/375. The tuner may be in a transit case, which you'll have to remove, first. Send along the pix.. please! Anything's possible!!

I have an old RCA power transformer, apparently from a low power AM broadcast station. I would like to give it to a good home. It is a Type: XT-2266, Class: Reactor, Primary Voltage: 125/115/105V, Secondary Voltage: 3470/3110/2410V. It would require being picked up in or near Huntsville, AL. because it is so heavy and I really don't want to practice my mediocre carpentry skills to build it a shipping crate.

There was a guy, well known but I can't remember the name, something like
"Jo Emmings", who wrote a number of articles about fairly unusual amplifiers.
He either worked for Eimac or Varian, or a company that made vaccuum
variables. The articles I've seen were in CQ, in the late fifties.

That author was Jo Jennings, W6EI. He owned Jennings Radio,
and manufactured vacuum variable capacitors and vacuum relays,
which were featured in his designs.

The CQ "New Sideband Handbook" (1958), edited by Don Stoner,
has a 4CX1000A linear design by Jennings. He got the rf deck
(less blower) to fit in a box 6" X 11" X 7".
The design used a passive grid circuit, and could be driven
by a CB power level rig.

Ed Knobloch

3488. OT - Knight KG-687 Sweep Generator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-23 04:35:48 UTC
From: Paul P <paulREMOVE@REMOVEppinyotREMOVE.com>
Message-ID: <EQ2Rg.396$KK.155@trnddc08>
Source record: 11038

Good morning all. I picked up a sweep generator at a local ham fest. A Knight KG-687 Sweep Generator. I figure that I would give it a try for some tough alignments of our beloved tube type equipment (e.g.. Hammarlund HX50 Transmitter). http://www.ppinyot.com/hammarlund.htm Restoring and aligning this beast is kicking my butt. Getting the RF amplifier and mixer stages balance ("linearized" or leveled across the dial) over the US allowable BW is very difficult. I am hoping a sweeper can aid me in this effort.

So I went and bought my self two sweepers. The above referenced Knight and an EICO. Both have identical control ranges and functions. But no schematics. Only a Knight Ops manual.

Any help would be appreciated. The Knight is not on BAMA (unless I missed something).

Thanks,
Paul P.

anyone with any radio knowledge at all knows that a "10 meter" amp is more than broad enough to be used on 11 meters with very little retuning required (hell, the band edges are less than 600 Khz apart!).

now, there are ways to make a 10 meter amp unusable on 11, but then, it would be mostly unusable on the lower end of 10 as well. :(

so..... the label of a "10 meter amp" os pretty much meaningless, unless you can come up with a bandpass filter that has a 90+db/decade slope and a cutoff just 40 Khz from the edge of band you want to work (good luck with that as the filter would be unwieldy in both size and cost). things like this can be easily done on the upper UHF spectrum where wavelengths are short and parts are easy to fabricate..... not so in the upper HF (wavelengths >6 meters). can you imaging a cavity filter for 10 meters? it would be as big as a house and have a bandwidth narrower than your transmitters operating frequency plus its associated sidebands (am or fm) and wider still than any ssb signal (on 10 meters)

the math on this is indisputable.

My understanding for the US, is that according to the FCC, if you sell ham gear as a business, it has to be type accepted, but you can "home brew" anything you want to use on the ham bands for personal use. If you sell your personal equipment, it doesn't need to be type accepted, either. Also, if you sell an amplifier as a business, it can't operate the 12 or 10 meter band. However, it can be modified to operate it, but that fits in the "home brew" category, again.
I think the stink arose on the posting, because the person posting the original listing, advertised it as a CB radio amplifier, which is illegal in the US and from what I understand, most other countries. Notice that the original poster has not posted in a while, I believe he probably has been warned, because it is off-topic and cross-posted to more than 5 groups, which is considered spam according to the TOS with most ISPs.

FS Drake TR-7 HF Transceiver. This TR-7 has the optional CW and AM Filters. It is in very good condition and works great. It has the sticky Drake cabinet, but is not all scratched up like some of them are. All of the dial and meter lights work. I purchased it from the original owner who did not use it
much. Copy of the manual included. Price is $400 plus shipping. I also have the Drake PS-7 Power Supply that came with it, but it does not work. It looks good, but will not power up the TR-7. I have been using another PS-7 with the TR-7. I will sell the PS-7 for $50 plus shipping after the TR-7 sells.
Thanks, Charlie Hugg, K5MBX

No, as someone pointed out, it was Jo Jennings.

I do recall an article in "73", I think in that giant November 1972 issue,
about someone running a kilowatt from a fancy car. But I remember it
as being a KWM-1 (though maybe he was showing an earlier version) and
a Heathkit amplifier.

Memory also says that article was by Don Miller, the SSTV guy not
the DXpeditioner.

There no FCC procedure for "type acceptance" of ham gear, so ham gear
can't *BE* type accepted.

There's certification for commercially produced ham gear, but that's a
totally different process from type acceptance, and it looks for
totally different things. Calling certified gear "type accepted" is
like calling a ham a CBer - using the wrong term (which seems to be
common practice in English for a couple of decades now)

> Also, if you sell an amplifier as a business, it can't operate the 12 or
>10 meter band. However, it can be modified to operate it

But not by something as simple as cutting a prominent wire that's
labeled "don't cut this wire". By changing capacitors and inductors,
yes - but that's home-brewing.

FS Nice Drake MN-2700 Antenna Tuner. It is the high power version and this one has the Drake B-1000 Balun installed. It has the sticky cabinet, but it does not look bad. It has a few scuff and scratches, but looks good. The Front Panel is Excellent.
I also have the original shipping carton and the original Drake Quality Control Tag dated March 29, 1979. This tuner has been stored for over 20 years and has seen little use. It works great. It comes with a copy of the Manual. Price is $475 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

Source record: 10897

I have two Collins 516F-2 Power Supplies for sale. Neither one has a
case.
Both have good cables and work.
1. SN 2623. This one is all original except the power cord has been
replaced. It has the original caps. $225;
2. SN 19717. This one has been completely recapped and has had a raised
ceremic tube sockett installed for the 5R4 tube. It also has had a choke
replaced with a non factory type. It looks good and works fine, but is a
different style. I believe that replacement chokes are available if one
wanted to make it completely original. I can send pictures. Price is $225.
Shipping is extra on both power supplies.
Thanks, Charlie Hugg, K5MBX, CCA #307

I think what people may be thinking about is that ham gear must be Part 15 certified (for the receiver) if it's commercially built, whereas home brew gear need not be.

S 97.315 Type acceptance of external RF power amplifiers.
(a) No more than 1 unit of 1 model of an external RF power amplifier capable of operation below 144 MHz may be constructed or modified during any calendar year by an amateur operator for use at a station without a grant of type acceptance. No amplifier capable of operation below 144 MHz may be constructed or modified by a non-amateur operator without a grant of type acceptance from the FCC.
(b) Any external RF power amplifier or external RF power amplifier kit (see S 2.815 of the FCC Rules), manufactured, imported or modified for use in a station or attached at any station must be type accepted for use in the amateur service in accordance with Subpart J of Part 2 of the FCC Rules. This requirement does not apply if one or more of the following conditions are met:
(1) The amplifier is not capable of operation on frequencies below 144 MHz. For the purpose of this part, an amplifier will be deemed to be incapable of operation below 144 MHz if it is not capable of being easily modified to increase its amplification characteristics below 120 MHz and either:
(i) The mean output power of the amplifier decreases, as frequency decreases from 144 MHz, to a point where 0 dB or less gain is exhibited at 120 MHz; or
(ii) The amplifier is not capable of amplifying signals below 120 MHz even for brief periods without sustaining permanent damage to its amplification circuitry.
(2) The amplifier was manufactured before April 28, 1978, and has been issued a marketing waiver by the FCC, or the amplifier was purchased before April 28, 1978, by an amateur operator for use at that amateur operator's station.
(3) The amplifier was:
(i) Constructed by the licensee, not from an external RF power amplifier kit, for use at the licensee's station; or
(ii) Modified by the licensee for use at the licensee's station.
(4) The amplifier is sold by an amateur operator to another amateur operator or to a dealer.
(5) The amplifier is purchased in used condition by an equipment dealer from an amateur operator and the amplifier is further sold to another amateur operator for use at that operator's station.
(c) A list of type accepted equipment may be inspected at FCC headquarters in Washington, DC or at any FCC field location. Any external RF power amplifier appearing on this list as type accepted for use in the amateur service may be marketed for use in the amateur service.

S 97.317 Standards for type acceptance of external RF power amplifiers.
(a) To receive a grant of type acceptance, the amplifier must satisfy the spurious emission standards of S 97.307(d) or (e) of this Part, as applicable, when the amplifier is:
(1) Operated at its full output power;
(2) Placed in the "standby" or "off" positions, but still connected to the transmitter; and
(3) Driven with at least 50 W mean RF input power (unless higher drive level is specified).
(b) To receive a grant of type acceptance, the amplifier must not be capable of operation on any frequency or frequencies between 24 MHz and 35 MHz. The amplifier will be deemed incapable of such operation if it:
(1) Exhibits no more than 6 dB gain between 24 MHz and 26 MHz and between 28 MHz and 35 MHz. (This gain will be determined by the ratio of the input RF driving signal (mean power measurement) to the mean RF output power of the amplifier); and
(2) Exhibits no amplification (0 dB gain) between 26 MHz and 28 MHz.
(c) Type acceptance may be denied when denial would prevent the use of these amplifiers in services other than the amateur service. The following features will result in dismissal or denial of an application for the type acceptance:
(1) Any accessible wiring which, when altered, would permit operation of the amplifier in a manner contrary to the FCC Rules;
(2) Circuit boards or similar circuitry to facilitate the addition of components to change the amplifier's operating characteristics in a manner contrary to the FCC Rules;
(3) Instructions for operation or modification of the amplifier in a manner contrary to the FCC Rules;
(4) Any internal or external controls or adjustments to facilitate operation of the amplifier in a manner contrary to the FCC Rules;
(5) Any internal RF sensing circuitry or any external switch, the purpose of which is to place the amplifier in the transmit mode;
(6) The incorporation of more gain in the amplifier than is necessary to operate in the amateur service; for purposes of this paragraph, the amplifier must:
(i) Not be capable of achieving designed output power when driven with less than 40 W mean RF input power;
(ii) Not be capable of amplifying the input RF driving signal by more than 15 dB, unless the amplifier has a designed transmitter power of less than 1.5 kW (in such a case, gain must be reduced by the same number of dB as the transmitter power relationship to 1.5 kW; This gain limitation is determined by the ratio of the input RF driving signal to the RF output power of the amplifier where both signals are expressed in peak envelope power or mean power);
(iii) Not exhibit more gain than permitted by paragraph (c)(6)(ii) of this Section when driven by an RF input signal of less than 50 W mean power; and
(iv) Be capable of sustained operation at its designed power level.
(7) Any attenuation in the input of the amplifier which, when removed or modified, would permit the amplifier to function at its designed transmitter power when driven by an RF frequency input signal of less than

50 W mean power; or
(8) Any other features designed to facilitate operation in a telecommunication service other than the Amateur Radio Services, such as the Citizens Band (CB) Radio Service.

True, but Part 15 testing has nothing to do with type acceptance. AND,
amateur radio gear is still required to meet the Part 15 radiation
specifications even if the equipment is homebrew. You don't need to
send it off to a certification lab, but if you're radiating trash out
of band, you're in violation of the law.

I'll say that the broadcast service normally requires type acceptance
on transmitters as well, BUT there's still an exception for homebrew
broadcast gear... your local AM station can put a homebuilt transmitter
on the air as long as it meets the technical specifications and it has
a nameplate on the front stating that it was homebuilt. (The wording
required is quite specific but it's listed in Part 73.)

It still has to meet Part 15 specs (all incident radiation devices
do), it just doesn't have to be certified before you use it.

That is not correct. If you ask "can I eat a caramel, my reply is you may
(permission) if you can (ability). For all I know you're toothless and have
no ability to chew.

If you correctly ask "may I have a caramel" the correct reply is, "yes, you
may."

Hmm, you think that spelling is a reflection on intelligence? Spelling is a rather arbitrary transliteration of vocal sounds into written text. I have known some incredibly brilliant people that couldn't spell their way out of a wet paper bag, and I have known some extremely facile spellers that couldn't reason their way out of that same bag.

The kids on IRC are using home grown abbreviations to cut down on the number of symbols they need to type to convey a message... Hams do the same thing when using RTTY, or CW.

I do... and it's amazing they can communicate at all.

So if everyone under 20 confuses "can" and "may" does this make the misuse of either word correct? Hardly. If a million people do a stupid thing, it's still a stupid thing.

Believe it or not, grammar does have a place in this world. It's the correct means by which we communicate. If we can't communicate correctly, we shouldn't be surprised when things don't go the way we want them.

Just my 2 cents.

3519. Need help on Navy RCA RBB-5 RBC-5 Receivers

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-25 17:24:32 UTC
From: Bill Bird <bbird97082no_spam@aol.com>
Message-ID: <45181162.10608@aol.com>
Source record: 10919

Hi, (2nd try to post, sorry if both show up)

I just purchased two receivers and the required power supply and connectors. They are:

Navy RBB-5, .50-4.0 MHz, built by RCA
Navy RBC-5, 4.0-27.0 MHz, built by RCA
Type 20130 Rectifier Power Unit, with 120V power cord, two receiver power cords
Two CN-49123-B 70 Ohm IMP. Antenna Cables with 4 plug panel

I have downloaded some partial manuals from the internet and am hopeful the seller will find the original manual for me soon. The power unit can run two receivers at the same time but manual indicates main usage is for one receiver at a time. I have powered up both receivers using an autotransformer to gradually get up to the 120V AC required for the power unit. Everything seemed to power up fine and the receivers show 200V DC coming into them on their voltage meter.

I am finding the following:

RBB-5 does not seem to receive anything from antenna, can hear steady static at high volume.

RBC-5 picks up only very strong stations like Radio Havana.

Outside of chassis and shield of antenna cables on both receivers seems to have about 60 volts AC on them.

I will be opening up the units soon to take a look. I have two tube testers and a VTVM for testing.

I have a vertical HF antenna and a beam HF antenna that utilize standard 50 ohm coax with PL-259 connectors. The 4 plug panel as I received it is set to connect to a one-wire antenna and a ground wire (and also the cables running to the up to four receivers).

I'd appreciate:

>ideas on how best to connect my antenna coax to these receivers. The RBB-5 actually has two SO-239 connectors on the back but still doesn't pick up any stations when connecting my coax directly to either SO-239.

>ideas on what might be causing the receiver chasis's to be "hot"
>ideas on what might be causing the lack of sensitivity (maybe my lack of proper antenna connection?)
>and knowing if anyone is enjoying using these receivers.

I'd like to use these receivers for both AM and CW.

Thanks,

Bill Bird

Chuck,
you do point out an interesting fact:
in the last 15 years or so, the written language of the internet has come
into its own. it is not unlike English in many respects (American English
is an "evolved" language, much like "net speak").

today's kids know this language well and it does, in fact, convey a lot
of information with a minimum of keystrokes. replacing letter combinations
(the ATE sound) with numbers (like 8) can shorten word lengths while still
sounding the same.

there is already research going on per this subject and several prominent
papers have been presented over the last few years.... it won't be too
long before someone actually engineers an alphabet for the net. that will
be neat to see.

and to think, hams are the ones that actually originated tis concept with
CW starting over 70 years ago.

> >ideas on what might be causing the receiver chasis's to be "hot"
==========
The AC line input to the power supply has capacitors bypassing both sides of the line to the chassis. That puts the chassis 60 VAC (one half of the 120 VAC line voltage) above ground regardless which way it is plugged in. Best idea is to install a 3-wire line cord and connect the safety wire (the green one) to the chassis. You can also use a polarized plug and bypass the neutral side of the line to the chassis and the hot side of the line to the neutral. The 3-wire cord is the best idea. --Ed

I and other readers of rec.radio.amateur.antenna would really appreciate it if you'd leave that newsgroup off the lengthy list you post this sort of thing to.

If you're not willing to do that, perhaps some of the people who feel compelled to respond would be thoughtful enough to remove that newsgroup from the list receiving the responses.

Well, this doesn't seem very relevant for folks here in
rec.radio.amateur.boatanchors. We think the requirements
should include being able to bench press a Collins R-390
and being tested on changing coupling capacitors with the
B+ live.

Other folks may consider other tests, for example testing
someone for the ability to hold down the key for ten minutes
straight while shouting "This is my channel, you don't own
this frequency" over and over again. This is a skill that
is becoming increasingly popular.

Hi all,

I am in need of four (4) type VT-4-C / 211A vacuum tubes
for display only. "Dud" tubes would be just fine as long
as they look OK. These will be installed in the BC-375-E
transmitter that is on display in the exhibit hall at our
Museum hangar. That radio will eventually be installed in
the radio compartment of our B-17G Flying Fortress bomber.
I am looking for a donation here, and once again I stress
that I'm NOT looking for good tubes because they are only
for display. We are a 501(c)(3) non-profit aviation museum,
and all donations are tax-deductible. Can someone help us
out with 1, 2, 3, or 4 tubes?

Thanks and 73!

The 211A is in current production by a number of manufacturers, and
the high end audio guys really like them. You might try asking on
rec.audio.high-end if anybody has any pulls. You may be forced to
use Chinese ones, mind you, but that is probably fine.

You have very leaky capacitor issues. First of all you will probably find
an RF filter on the incoming power line made with a couple shunt caps.
If those caps are paper types, they are leaky and this is almost certainly
the source of the AC on the case. Replace those caps.

The poor RF performance and the leaky filter caps make me suspect that
you have a lot of other paper caps inside that have gone bad. Be VERY
careful of coupling caps used for DC blocking on the IF cans... replace
them immediately before they go bad and destroy an irreplaceable IF
transformer.

>I will be opening up the units soon to take a look. I have two tube testers
> and a VTVM for testing.

The tubes are almost certainly fine but it won't hurt to check them. You
will find a DVM is more convenient than a VTVM, but my basic feeling about
paper caps is that you're better off replacing them now rather than testing
them, replacing the bad ones now, and then having to replace the rest of
them later.

The orange drop types are reasonable replacements for a decent price,
but there are plenty of other good alternatives.

Either Slow code learn to send code at 60 WPM with his tounge in a
live line voltage lamp socket, or stop posting on usenet forever and
under any other stupid name.

I have two VHF Transceivers for sale cheap:
1. Icom IC-27H, 2 Meters, 45 Watts, has Mic, Manual, Mobile Mt. Tone Board. This transceiver
looks new and transmits with full output. But the receiver audio is very low. I would guess that the
audio transistor is out. Everything else works great. Price is $55;
2. KDK Model FM-2015R 2 Meters, 15 Watts, Mic, Manual, Looks and works like new. Fixed Tone,
Price is $60. Very little time on both of these radios.
Shipping from 79602 is extra. Thanks, Charlie Hugg, K5MBX

Yes, that's the ticket, back to the past. As if enough people weren't abandoning ham radio already. I have never thought that code was essential. It is just another "hoop" that someone has to jump through. Once I passed the code test, I never used it again. Get real, this is 2006, and with all the innovations on the radio spectrum, code is the last thing on people's minds.

If there is ever a serious emergency, including no commercial
communications, guys like you who can't build a simple transmitter and
companion receiver, and can't do code, will be the first to scream for help.

What makes you think people are abandoning ham radio? I don't see that at
all, but I do see a reduction in new hams. But..... What goes around will
come around. Ham radio will grow again if the ARRL will quit mucking it up
with their friggin yuppy, elitist attitude.

Don

Where did you get the part that I cannot build a radio? I simply said
that I do not use code anymore! I have built many radios, repaired
them and use them to this day! This attitude is typical of
old-timers, and I am 54 myself! How may radios have you built pal?

I agree with you on the ARRL! They are the ones who constantly keep
pushing for "code" requirements to be raised! Check the figures on
hams around the country. At a recent South Florida hamfest, it seemed
that I was the youngest guy there!

Well, if that's the case, why not test them on use of the new innovations?

How about making them demonstrate competence operating five different
modes of their choice? They can choose between HF SSB, VHF/UHF FM, CW,
SSTV, fax, RTTY, packet, what have you. That way folks who want to learn
code and might use code have an advantage, but folks who can type 130 wpm
also have an advantage...

I'm relatively new to the group, but I can already tell you're the group troll.

Having been active in the rec.photo groups for sometime, I understand trolls, but at least you have a beef with something tangible.

Let's face it. You most likely are one of those who got their General at 13 WPM, maybe their Extra at 20 and hate the no coders and those who got their license by only taking code at 5WPM. Well, who cares. It's time for you to accept reality and come to the conclusion, you out lived Morse Code. Get on with life.

Jim Philopena
KB1NXE - Formerly KA1VGP, DA2PJ and WN1VJW

If you have a Call Book with that last one in it, you have definitely out live Morse Code - time to get back to ashes and dust.

> --scott
Scott,
I agree with you! It is organizations like ARRL who continue to
insist on Code! Keep up with the times and test over what is current
and actually being used. I have a restored 1940 Chrysler but I also
have a 2005 PT Cruiser with A/C and all the options. I enjoy the
1940, but I would not take it on a cross-country trip.

No, not at all. There is a lot less cussing, spitting, passing of gas into the mike, usually no electronic sound effects, and rarely a "10-4 good buddy." I'd say the average ham has an 80 point higher IQ, than the average Cber.

3558. FS Ultimate Collins S-Line

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-27 01:43:41 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <VGkSg.669$uJ2.582@dukeread03>
Source record: 10958

I am putting up for sale my "Ultimate Collins S-Line". I just don't use it much and I need to sell it. I am sure that I will kick myself in the future. But here
goes:
All of this gear is CCA EXCELLENT:
1. Collins Round Emblem 75S3-C Receiver. MCN 1674(SN Sicker has fallen off, See picture) Includes 2.1 SSB Filter and 500 Hz CW Filter. Very Nice Works Perfectly. It has T-9. Some extra Crystals. Gone Through by Dennis Brothers.
2. Collins Round Emblem 32S3-A Transmitter. SN 3127. Very rare and very nice. Works Perfectly. Gone Through by Dennis Brothers.
3. Collins Round Emblem 516F-2 Power Supply and RE Cabinet. SN 22007. Looks and works like new. NO MODs.
4. Collins Round Emblem 312B-4 Station Console. SN 70368/MCN 5368. Spotless!!
5. Collins Round Emblem 30L-1 Amplifier. This one is practically new.
6. Collins Round Emblem SM-3 Microphone with original box. SN 5705. A few spots on base, but very good.
7. Collins Crystal Pack, complete with Pouch and Extractor, Looks brand new.
8. All equipment includes original Collins Manuals and all Interconnecting Cables.
9. Original Collins 1978 Brochure and Price List, includes all the above equipment.
This is a very nice, rare S-Line. You would be hard put to find a nicer one. Price is $8900.

I have lots of digital pictures of this equipment. If interested, please e-mailfor the pictures. Thanks, Charlie Hugg, K5MBX, CCA#307.

Well, I sort of thought it might draw a few "Oh, gee, I guess commercially
made ham linears have to be FCC type accepted after all"'s.

The guy making the CB linears fails a whole laundry list of requirements
for type acceptance of a Ham linear.

And because he isn't a ham, he cannot legally build even *one* such unit,
let alone go into production.

Well, the argument is that you have to do _something_ to ensure that people
licensed are competent operators and have some usable skills. I think the
code requirement is not the best way of doing that, but it's better than
nothing. The only alternative I ever seen proposed is just that, nothing.

So, I am in favor of dropping the code requirement, IF it can be replaced
with something else that helps ensure licensed operators are competent and
skilled.
--scott

But then, I _would_ take a 1940 Chrysler cross-country.

That was the Class D citizens band. I believe Class C is also in the 27 MC
range, with low bandwidth digital modulation for remote control, etc.

Whatever happened to classes A and B? I recall Class A was AM on the 460 MC
band.... took a huge amount of bandwidth both because of the modulation
method and the fact the transmitters were generally not very stable...

I don't think anyone except him thinks otherwise.

The thing is... what will the FCC do about it? And are they going to do anything about the touch lamps sold at my local Wal-Mart which spew trash all over the HF band, or the local computer store which has a roll of "FCC Part 15 approved" stickers which they put on uncertified (and often uncompliant) PCs?

Interestingly, I note that none of the opinionated even mentioned the posting of the actual regulations...

Lots of postings by those with opinions (99 & 44/100 % of which do not match the regulations..)

TO recap:
**A person who is not a licensed amateur may NOT build HF amps unless approved with a type acceptence certificate.. **
Notice it is not limited to sales restrictions.. It says may not even build the first one to begin with...

**An amateur licensee may build OR MODIFY just one HF amplifier per year.. **
Most hams are not aware of this rule and many, <including me and aware of it>, are in violation... Jeez, I have my hands in an amp at least every few weeks...

From: novatech@eskimo.com
Message-ID: <efecma$qg1$1@eskinews.eskimo.com>
Source record: 10972

I managed to get a NIB BC-454-B for pretty cheap. I decided to keep it 100% original, so I put a Dynamotor on it and cobbled up a 28VDC supply. Works great as a WWV monitor.

I've never run a dynamotor this long before. The question is: What is the proper running temperature for these small dynamotors? Seems quite hot. (Yes, I repacked the bearings).

I have another dynamotor, not for the BC-454, that says "50C continuous operation" Is that how hot it gets or is that its expected ambient.

TIA.

Steve.

Slow Code wrote:
> Dumbing it down cheapened the license, making being a radio amateur
> nothing special. No wonder they leaving.
>

I'll bet that most of the folks "leaving" are simply not renewing being SK. Code is in a way a dying art quite literally. Which is a shame.

We have to face it, this hobby doesn't attract a lot of new blood and the existing stock is rapidly growing older. The advantage to me is that I can find old ham equipment at estate sales for next to nothing but that's not what I'm posting about.. :)

I don't think things are all that "unfair" with the maximum code speed we currently test being 5 WPM. Of course that's what I got tested at so you can charge bias if you want. I currently don't operate CW (heck, I don't operate at all right now) but all that spectrum space in the lower part of the bands is starting to beckon. I've got a code practice program and I work on my code from time to time so maybe someday...

So where do I fall in this debate? I certainly don't favor the removal of the code requirement for all license classes. Extra's surely need to be tested at the current 5 WPM. But the fact remains that the interest in this hobby as shown by the decline in the number of licenses needs some attention.

We don't need to "dumb" down the hobby to get more folks in it, but we do need to bring the requirements into the current age. Before the advent of the personal computer 20 years ago, it would have been very expensive to set up an automated CW send and receive station, but now you can do it for next to nothing. One can actually send and receive CW without ever learning it and get transmission rates much faster than just about anybody can copy by ear, just hook up your PC to the rig load the software and voila, the no code licensee is sending and receiving at 25 WPM the day after he failed the 5 WPM test.

On the other hand, you guys that struggled to get their code speed up to 20 WPM so they could get their Extra have my respect. I understand that lowering that requirement seems like we are dumbing down the hobby, but I hope you can understand that like AM, CW is being replaced by other modes that you and your generation have pioneered.

My greatest fear is that the FCC will totally do away with code in it's testing requirements, which will logically lead to a mass spectrum

reassignment to make more room for voice and we will likely loose our valuable spectrum space in the process. But once the last license goes to SK what's to stop the FCC from giving it all away?

May code never die, there are times it's the only option, but we have to keep the hobby relevant or it will all go away when the hobby dies.

I don't think the code require is necessarily "unfair" somehow, but it does seem awfully "arbitrary" these days. In *today's* world, it's just one mode of many, and a rather unpopular one at that.

> So where do I fall in this debate? I certainly don't favor the removal
> of the code requirement for all license classes. Extra's surely need
> to be tested at the current 5 WPM.

If we're going to make people show a certain commitment to amateur radio before giving them advance privileges -- reasonable enough --, to me it seems that the study should be of something more people are likely to use... say, error correction coding theory, or modulator design or something. Or maybe something even more practical such as demonstrating the ability to perform link planning (antenna selection, power selection, etc.). I imagine one of the reasons CW testing remains is because it is so easy to test compared to those options.

I think I'm pretty much in agreement with you... 5 WPM is not an unreasonable barrier to entry, and I don't particular oppose keeping it around, but I do think it seems awfully arbitrary, and this refelcts somewhat poorly on hams as a group trying to present themselves as modern and professional.

I was under the impression that CW would get through under worse
conditions and/or with lower power requirements than other modes.

Does no one run "flea power" anymore?

I sometimes listen in on 10 meters but don't hear much there. A bit of CW
every now and then, but not much of anything, usually. Maybe I'm listening
at the wrong times? Or is it mostly vacant and just freebanders buying the
10 meter rigs?

Just like any power supply, make sure that the circuit supplied by the dynamotor is all ok .

Check those paper caps etc.

Is the current on the HV side within spec?

Etc

Scott,
I took the 1940 Royal Coupe on a mini-cross country trip here in
Florida, managed 60-65 with the overdrive, the original factory AM
radio pulling in at least 10 states, remember those days! Got about
19-21mpg with the old flathead 6, but the 2/60 A/C wasn't really up to
snuff. Once I opened the cowl vent and the vent windows turned all
the way in on us, it became tolerable. Waiting for the winter months
here in Florida to really enjoy the old car.

Well, one of the nice things about code is that you don't _need_ very
much bandwidth. And with modern DSP you should be able to make IF filters
even narrower than my old R-390... should be possible to cram hundreds of
carriers into the space of one SSB channel.

And hey, what's happening to the 500KC marine allocation? That's pretty
much dead... I wonder if the ITU could be convinced to give that to the
ham radio operators. Nobody else wants it.

>May code never die, there are times it's the only option, but we have

I don't think code ever will die, but I could see a world in which it is
even less relevant than it is today. That's not to say we shouldn't encourage
its use.

So true, and low bandwidth helps CW get though when SSB would be
impossible. However, don't forget that CW can be done quite nicely with
a cheap computer, some simple cables and some free software without
learning it. I suppose that one could argue that a human ear can hear
what a computer can't, but I'd be willing to argue that point in favor
of the computer.

I'll be willing to bet that there won't be much improvement over CW in
the raw "get the message though under bad conditions" power with the
new digital modes using the same bandwidth as CW. Simple is
under-rated in my book.

As an operating mode CW is alive and well and likely to stay, however
it will be computer driven more and more as the art dies off and new
blood is not required to learn it as well as the old.

Change is neither good or bad, it's just change.

Has much to do with where we are in the sunspot cycle. A couple or three
years from now
10 meters will start to be much busier. It's my misfortune I got my upgrade
to General a year before the dead bottom of the cycle. At the age of 74 I'm
just hoping to be around long enough
to see what the high point in the cycle sounds like.(G)

Yes that can be true. They speak of PSK as being low power but that is only
low transmit power. It takes more power to generate a 25w PSK signal than a
100watt CW signal. Computers draw a lot of power.

> Does no one run "flea power" anymore?

Bad point in the sunspot cycle for 10 meters. It does open occasionally but
not like it does at the peak of the sunspot cycle. Right now it is not open
every day (although it may be open for a while each week). And the time of
day it is open tends to be when people are working, doing errands after
work, etc.

I have gotten a couple of emails asking: "have you checked all the
loads, capacitors, etc.?" Yes. The loads are perfect. I am thinking
these beasts must just be hot runners.

Actually, you would lose such an argument. There are many hams who have
proven that they can decipher better than the computer. The computer
hardware or software requires the following characteristics in the received
transmission to work:

1. A strong signal
2. No distortion on the signal such as occurs from aurora, meteor scatter,
etc.
3. The code sent is nearly equal in quality to that sent by a computer.
Some one using paddles may achieve that but if they are sending with a
manual key or bug, that is highly unlikely.

I have frequently been able to copy better than the computer and my code
skills are quite modest. The only time it beats me is when the code meets
the above three criteria and is too fast for me to copy.

Various digital modes do better under low SNR conditions than CW, but they do require a computer at both ends to perform the encoding and decoding -- some people don't like that fact, that you seemingly need "more equipment" to work such modes than you do with CW. It's a bit of a red herring, however, in that these days pretty much every single amateur radio being sold commercially has a processor (computer) in it anyway, and while some are strictly for "control" (not modulation/demodulation), the percentage that does have raw number crunching power increases every day, and within a decade it's a fair bet that over 90% of all commerical amateur radios will use DSP techniques for modulation and demodulation. (Cell phone went to DSPs somewhere between 5-10 years ago now...)

> Does no one run "flea power" anymore?

Absolutely they do, and it's a really cool part of the hobby... but for every 100 amateurs, I would guess that the number running QRP on a regular basis is about 1.

My sole experience with QRP was accidental. I had reduced power to 5 watts
to tune to a different band (17 meters) and forgot to turn the power back
up. As a result I found myself speaking to a Swiss ham form my southern
Oklahoma shack with 5 watts and getting a reasonably good signal report. I
realize that for real QRPers 5 watts is high power, but for me it was an
unusual pleasure. Moreso because bad weather had me using an indoor dipole
mounted on the wifes sewing room ceiling (about nine feet above the earth).

Man, do anything you can to stick around. It's going to be good, and 10M
FM is just more fun than anything. Get a PRC-8 and take lots of vitamin C.
I predict that this next peak is going to be a really good one, at least as
good as '78 was.

They are. Most that are intended to drive a transmitter have an intermittent
duty rating. They are turned on when you key the transmitter, and turned
off when you release.

The units for receivers usually run on the warm side of cozy.

It all depends on the quality of the insulation. Most WW2 stuff used simple enamel and varnish insulation on the wires-- you probably don't want to push that much above 50C for very long.

The general rule-of-thumb for old transformers and other things with windings is: If you can hold your thumb on it for twenty seconds, then it's okay. Actually, better than okay, the warmth drives out the moisture which is the number one killer of aged transformers.

Actually the rotor and commutator are what get really hot-- you can usually tell by smell, if the output air from the dynamotor smells like varnish, it's too hot-- the varnish is slowly vaporizing, eventually something is going to short out.

Signal to noise ratio would be important, to be sure, however with the
proper application of some limited computing power I'm sure one could
construct a detector that would work with seriously low SNR. It is
amazing what DSP's can do now days..

> 2. No distortion on the signal such as occurs from aurora, meteor scatter,

Sending code is not in question. Surely a computer is able to open and
close the keying faster than a transmitter can possibly transmit.
Also, remember that the faster you key, the higher bandwidth your
signal will require and the higher the SNR will theoretically need to
be for it to be decoded at the receiving end.

> I have frequently been able to copy better than the computer and my code
> skills are quite modest. The only time it beats me is when the code meets

I would contend that the software you are using is not utilizing the
inputted signal at it's full potential. I've seen audio processing
techniques that could pull out inaudible signals that where more
complicated than CW would be.

I would also ask if you where copying random characters or where you
able to "fill in the gaps" by using the context? The latter would be a
very different problem for a computer to solve.

I'm saying that if you pick any digital mode, restrict the bandwidth to
that of the CW signal with the same data rate, keep the SNR the same
with the same error rates, CW will be about as good as you can get.
Not bad for an operating mode that has been around as long as CW.

Define "common operating conditions".

For a contester, common operating conditions often include murderous QRM.
Yet contesting is common. I've always maintained that one can construct
various scenarios such that there is one where the particular mode under
discussion is "the best".

For ragchewers, common operating conditions often include manually sent CW.

Yes and there are some very fine software programs already available. But
even so they fail before the "EAR" fails, assuming a trained and experienced
operator.

>> 2. No distortion on the signal such as occurs from aurora, meteor
>> scatter,
>> etc.
>

> Again, I've seen spectral displays that clearly show CW transmissions

>

So I've seen displays of many types of signals that cannot be heard. That is an entirely different issue from distortion. When the auroras start playing, PSK (as an example) is so distorted that no matter how strong the signal, the computer cannot decipher it. If a CW signal is distorted but loud enough to hear, the human ear/brain combo can still decipher.

Receiving is the issue. If the received code was manually sent, the computer often fails.

I''ve tested everyone I could find. I'm one of those people who gets pleasure out of trying all the new gadgets & software I can find and afford. I've also seen inaudible signals pulled out of all kinds. That's quite feasible when the bands are in good shape. Add a little thunderstorm activity, geomagnetic disturbances, solar flares, etc and the machine can't decipher them. It's not a matter of signal strength but a matter of signal quality.

> I would also ask if you where copying random characters or where you

Yes it is a different matter. Humans definitely have the edge on "fill in the gaps".

>

Ok, I understand. Actually many digital modes are, by their nature, narrower than CW already. You would have to open up the filter to get to the same bandwidth. Again the key item is quality of signal. For example, aurora induces phase shifts on PSK (phase shift keying) and makes it undecipherable. It also induces phase shifts in voice and CW. It gives the voice & CW signals a buzzy, raspy sound. Yet you can often understand voice when PSK is undecipherable. CW, when there is a phase shift, sounds like a series of buzzes but can still be copied if you are used to it.

And yes CW does a fine job and will continue to be advantageous under certain conditions.

I believe that 50C continuous operation means that is the maximum
temperature for continuous operation. Ambient air temperature (and even
altitude in airborn stuff) as well as circulating air make a world of
difference. Smoking the shellac is not good, and can be smelled easily if
you remove the end dust caps, and leave them off. In the golden days, I
thought something was wrong with dynamotors on surplus so-called Command
Sets if I couldn't leave the palm of my hand on the dynamotor for 10
seconds. Ouch, ouch, ouch........

Source record: 10864

Hello Swan Gurus. I came by one for not a lot of money. It's rusty but works on most bands. Problem is the vfo output is very low whenever they multiply. i.e 40, 15 and 10. 80 and 20 are just fine. I've peaked all the coils (They do peak) and have swapped out the vfo amp tube. Any ideas? I've looked at the vfo output in a communications receiver. Fundamentals are fine but second harmonics are way down.

Thanks,

Tony WA6LZH

1 pound of stuff packaged will cost $6.05 to ship to most of the US from
Florida.

Even using a free Priority Mail box, other costs can easily total a buck.

A free Priority falt rate envelope that will hold a lot more than a
pound of many not very fragile things, including transistors, costs
$4.05 to ship anywhere in the U.S.

We ship a lot of stuff, and use PM flat-rate where appropriate. The $8.10 boxes can be a bargain for heavy items. To prevent damage in shipping, I would use a 1096S box for something like this. Some people try to save money and use flat-rate envelopes for things they were not designed for. It usually works, but most experienced eBay sellers won't risk the negative feedback when something arrives damaged.

Many people don't realize the extra costs involved in selling on eBay. You might be surprised how many rolls of packing tape we go through. Bubble wrap was $35 for the last roll. Packing peanuts are about $10 bucks a bag. When not shipping PM, padded mailers are 35 cents, small boxes about 50 cents. Even the cost of printing labels and packing lists adds up. And if we miss the pickup and have to make that run to the Post Office...

And wait until you see what happens when that jiffy pack envelope you sent parcel post tracking (tracking is required by eBay/paypal) gets crushed down to under 3/4 inch, and you find it returned to you for insufficient postage.

How do you know? Just because they aren't licensed doesn't mean they can't copy CW. My officemate has no license at all but thanks to the military can probably copy better than I can.

I'm not licensed to do LOTS of things that I can do.

Many use "QSO" as a signifier of a "Voice" contact as well, so "why" couldn't you have a "QSO" with a "NO CODE" Tech? Now, if the question were a QSO with one on a band he wasn't licensed to use, then the answer "could" be NO. BUT - if he has a "Control Operator" there with him to allow his use of that band, then by all means - the answer is still "yes".

Its all in how it is looked at. Too many people split hairs.....

>Old Chief Lynn

I found an old manual in my stash that talks about "FITCAL" for
checking out old radios. This TM-11 manual said that the dynamotor is
okay if you could "lay your palm on it for 5 seconds without
discomfort."

Reading that as a spec, my dynamotor is running just fine. There's
no smell of burning.

The radio room in a B-17 must have been buzzing with dynamotors...

Thanks,
Steve.

What's wrong with that, if it helps motivate people to be better hams.
Unfortunately, most here don't want better hams.

I think screaming is more the word. I remember walking alongside of
a B1 at an air show when someone fired up the Auxiliary Power Unit (APU).
Now that was loud. The airplane folks never seem to worry much about
how noisy their planes were inside. They just wore ear protectors.

Yes. I'll do without before paying someone to cheat Ebay out of their cut, and insult me with a ridiculous shipping charge. (I have seen a box of stuff for sale for a $1, with $1999 shipping.)

I have told many sellers that efficient shipping puts me in the mood to bid high. It may be more emotional than rational, but it is also a fact.

My favorite shipping story is a load of large ferrite toroids, shipped in a $4.05 flat rate envelope. The shipper said there was not room for sufficient padding to prevent breakage in that container. I told him that the only threat to the cores was one banging into another. If taped together into into a solid cylinder, they might break something else but they would be no threat to each other. I accepted responsibility for any breakage if he agreed to ship this way.

I have since received 3 sets of these cores this way, without a chip, though the envelopes look pretty ratty by the time they arrive with their 3.5" diameter by 8 " long 5 pound cylindrical charges. I have saved enough shipping on these 3 sets to pay for a fourth. :-)

I am looking for a 68 pound lead brick to ship to somewhere in the $8.10 flat rate (up to 70 pounds) box. It might even be fun to shape a 1 inch thick slab of lead into an 8 by 10 inch rectangle, to ship in the flat rate envelope.

Yup, you are right there, but I imagine that with those four Wrights hammering and shaking out there, with the wind screaming by (and through) the compartment, the dynamotor noise was difficult to detect!

The B-17's liason BC-375 transmitter had a real whine from it's 1000 volt dynamotor too. Quite a nostalgic synchronized yooping with the transmitter's keying when running it full tilt. In the middle 1940's, just after WWII, Keith Martin, W7KGV ran one in his dad's garage. It took about two, 24 hour days to charge up the old auto batterys collected to run that dynamotor for a half hours work on 40 meters. Awsome! Those four VT-4Cs were bright enough to read your copy and fill in the log.
But I digress.....
Old Chief Lynn, W7LTQ

Doing that cuts out all sorts of protections. Even insured, the Post Office
won't refund postage for lost items and eBay/PayPal don't insure S&H, only
the goods themselves.

And some idiots insist on you buying $1.30 insurance on a $1 item. That's
the dumbest bet on the planet.

Many also don't seem to realize that it is their stuff till it reaches
my hands. They demand insurance or deny any responsibility for it
getting to me. Like I am required to give them a positive comment
when it doesn't show up, unless I have asked them to insure the item.
The insurance protects them, more than me. Same with documented
delivery. If it doesn't get to me, I am going to get my money back
from the credit card company, regardless of how they whine about no
insurance.

I have spent thousands of dollars to buy from eBay and have gotten
only two negative comments. Both in retaliation after I gave a
negative for poor shipping. One was incensed that I gave him a
negative before asking him to replace material damaged because of
complete absence of packing. He had no concept of getting a
compliment for doing it right the first time, but thought it fair that
I give him as many attempts as it took to finally get a fragile item
to me in one piece, and then give him a positive comment.

Telephony has saved magnitudes more lives than CW.
If you are CW only, you are not properly equipped
to even attempt to save lives.

Hmmmmmm - my how we belabor a point. MAYDAY IN CW = SOS..... SOS is
usually sent in those cases. SOS for the CW and Mayday for radiotelephone.
MAYDAY is "also" asked about in some RadioTelephone license exams for
"marine" use and is even becoming part of the Fire service. There is a test
specifically for "Mayday" and its uses. Mayday is "generally" used in
"airplane" emergencies.

And you're the fellow who suggested stuffing the transistors into a
flat-rate envelope to save 2 bucks on shipping?

I do agree that it is the responsibility of the seller to get the item to
you safely. That takes packaging appropriate for the item. And sometimes
even mandatory insurance for expensive fragile items.

Jeff

So don't buy it !

I really don't object to a reasonable S&H charge (and that may seem higher than you might expect) if it means the stuff arrives in good condition and speedily, which it usually does.

Shipping is "not" rocket science, though some still can't seem to master it. Not "all" shipping is created equal. When I sell, I check "all" options available to me for shipping. I let the buyer know what their options are as well as prices and ask for any preference. The customer can choose to pay for the carrier of their choice (among those offered). I find the Post Office "usually" but not always cheapest. As to packing, it does benefit the seller in reputation and aggravation - to package the items properly. In the end, so long as the buyer knows what to expect and "gets it", all should be happy.

Though it sounds silly to insure a $1 item - here is a "possible" answer..... If it arrives broken or it is lost - then a refund has to be made by "someone"! The seller "may" be counting their time and packing materials in the cost (which can add up) and wish not to lose out in the event of any problems.

Just my 2 cents

One method is not appropriate for all items. The pound of transistors
doesn't look very fragile to me. On the other hand, I have gotten
ferrite cores shipped in a very oversize box, with the cores laying on
the bottom and the large extra space filled with loose wadded
newspaper. Would have worked great, if someone had hammered on the
top of the box. But normal handling (the box was undamaged) had
tossed the cores against each other, like china dishes, and all I got
was a box of coarse black sand. Banding them together and shipping
them in an envelope, with no padding, would have been much better.

The item I gave a negative comment on, were solenoidal inductors, bobbin wound, with hair-fine wire, and having sharp, stamped, PCB pins. They were dumped into a manila envelope with no other packing, and not one arrived without tangles of cut wire hanging off them. The seller paid about $2 for first class shipping (no insurance), but I had paid him $8 for the shipping, to include insurance. Then I was lectured by him about how you don't damage someone's reputation with a negative comment without giving them every chance to make things right. He said he didn't insure them, because he had a lot of them, and would send more if these arrived damaged. Of course, he didn't tell me any of this before the damaged ones arrived.

I think the comments are there to warn other buyers about brainless, negligent or dishonest sellers and to reward sellers who do it right the first time.

Sheeeesh! Last time I ordered ferrite cores, they were shipped in a
pressed foam container... each core had its own little depressed area,
so they were immobile... at least enough that they couldn't bang into
each other.

Those sound like new cores. I am talking about stuff from someone's
garage. This is eBay, after all.

3660. Harvey Wells T-90 question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-09-30 18:11:20 UTC
From: "Joe L." <joe@falseaddress2004.net>
Message-ID: <joe-7C6186.13112030092006@comcast.dca.giganews.com>
Source record: 10811

Hello. I'm fixing up a Harvey Wells T-90 transmitter and have a question. Perhaps another T-90 owner would be so kind as to help.

The tube socket resistance table in the instruction manual states that the resistance from V9 pin 8 to ground should be 400 ohms. Same for V10 pin 8 to ground. These are the grids of the modulator tubes, fed in push-pull from the secondary of driver transformer T1 which has a center tap to ground. In my unit, the resistances are only half that much (211 ohms and 223 ohms). I'm suspicious that the 400 ohm value in the resistance table might have been meant to pertain to the *total* resistance between the two grids.

It would seem an unlikely coincidence for the transformer to have failed with shorted turns and end up with exactly half the specified resistance in both halves of the secondary. Of course, that's always a possibility.

Would someone else with a T-90 please help by checking these resistances for me? I would appreciate it very much. (Disconnect the transmitter from the power supply while making this measurement.)

73 & TIA,
Joe K9LY

Replying to this and the subsequent posts - I've seen so-called businesses on e-bay pack worse than individuals. You just never know. I learned LONG ago, to pack like the Samsonite commercials use to display - "rough" handling. My "ex" mother in law sent a box of glassware to her daughter in law one year. They were packed well and proven as such. When we went to the UPS office, the business was transacted and they were told it was "glass"..... The UPS lady picked the box up and gave it a heave ho to a pile. My "ex" mother in law was pissed. BUT, the package "did" survive the journey. Again, it isn't rocket science, but many have yet to master it. Some "may" not want to "buy" a lot of supplies if they don't sell "regularly". No big deal, go to most any store and you can acquire boxes and foam for free that their store displays came out of. I have an appliance store near by, I can get most any size box I need. Then too, if you GET packages - SAVE the bubble wrap/peanuts/etc. It doesn't have to cost a mint! It doesn't have to be confusing. It doesn't have to cause problems for the buyer or seller.

What kills me, is when "I" get an item which is shipped in a box 6 or more times the size of the item..... Talk about overkill!

><snip>

I once packed a box containing a monitor and keyboard to be shipped ahead of me (I was flying) via UPS to a destination cross-country. I had packed it using shaped foam that was at least 8 inches thick on all sides and bottom and there was almost no possibility of inner movement of either the monitor or keyboard. When I picked up the box there was a nice hole with some 5" diameter dead-center on one of the faces. On opening the box I found the keyboard had been demolished but the monitor survived.

On closer look, it had the rough appearance of a sharp, conical penetration. It was definitely NOT blunt damage. I then began to imagine the idea that UPS keeps a steel cone mounted on their cement factory floors, just for the occasional frustrated WHACK their employees sometimes need to do to a box.

I really couldn't have anticipated this kind of penetration. It was sharp, narrow, deep, and had enough of an impact to press through a lot of foam and to then still break through the keyboard.

If you use Priority Post and create a label on the website you get tracking
for free. Unless all of the packing etc is included in the item price it
isn't covered by insurance.

And if you've ever watched UPS or FedEx 'deliver' parcels by kicking them
off the back of the truck onto the road you'll really want your vintage ham
receiver well packed - preferably with 3" of bubble wrap and not just a
bunch of foam peanuts.

Actually, packaging IS complex. To optimise it fully takes as much command of physics and calculation of likely operating conditions as electronics! (Commercial hauliers put a lot of R+D into packing, as do makers of expensive equipment).

What makes it easier is two things: the cheapness of overengineering for safety, and our more easy tangible grasp of the facts. A limited number of stock items also makes choices easy.

If you know what you're buying, you can always specify packaging to the seller. I bought a second-hand hard drive and knowing the tendency for some people to use layers of newspaper for fragile stuff, and knowing how dense and incompressible that stuff is unless you take lots of time to form crumple zones, I asked the seller instead to just get a larger box, I don't care how rough it is, and to put all the shitty scrag ends of bublewrap he'd not want to indignify anyone elses parcel with around that drive. He didn't have to think, he was happy to shove all the crap that would fit round it, and it arrived in perfect order.

Another time I wanted three HeNe laser tubes. I made the box and lined it myself and put rolls of paper where the tubes should go, sent it to the seller, said replace paper with glass, send it back. Again, it worked perfectly, and it's always worth specifying somehow, if you know the product better than the seller does. This is almost always the case when buying electronics or optics parts from eBay surplus suppliers.

That won't work for full-on commercial sellers but they've (hopefully) got decent arrangements made. It's works great for private sellers though, who usually have the remains of packaging from private buying.

Joe,I have a H/W T-90 The mod driver shows 400 Ohms one side and 390
other side. On these older rigs it is not uncommon to find un-balance
in the windings and many have had the driver xfmr replaced,,windings
are extremely small. gauge wire..I know the people that built them
never expected us to be using them over 50 years later...hi..A great
little rig... 73 Harold W4PQW

A spray can of insulating foam and a roll of double sided tape can make
stuff survive a trip around the world.

When I was staff consultant at GenRad, they used plastic bags around
the object to be shipped, then blew them up with some kind of foam,
thus form-fitting support.

While you "could" be right about the calculations, R&D - etc of "bigger"
places, I think the gist of this is for "small" businesses (mom and pop) AND
individual sellers - the e-bay and newsgroups buying crowds. THEY don't use

high tech or high priced packaging. If you "pack" it securely - as you would want to "receive" it - chances are you'll do a good job. Simply "throwing" something into a box - adding some newspaper or peanuts and not "securing" the item or cushioinng it - is half assed. Yes, it does take "some" effort to pack - but again - it isn't "impossible" to get the hang of!

Fed Ex doesn't pick up (packages) near me - the closest place I know of, is their terminal - 40 miles away. So, I use UPS and USPS. I've had a decent record so far sending and receiving.

Wouldn't be enough. You'd want to pack 'peanuts' into every internal
crevice too, to sustain that impact, and pack tubes separately, etc..

You'd do better taking a photo of the delivery and posting it on the net
with a clear picture of the guys face. Someone will pay you handsomely to
have that pic removed.

Thanks Harold for the quick response! Darn, that must mean my driver transformer *is* fried. It's the original one because the factory-applied red varnish on the solder joints is intact. So, the hunt begins for a replacement. It's got a Thordarson part number stamped on it (T-54296) but it's not listed in either of the two Thordarson catalogs (dated 1942 and 1980) that I found on the Web. Maybe it was custom made for H/W.

Also found an open 27K resistor in the clamp circuit. Finding a replacement won't be as tricky as finding the transformer, hi.

It's true, no one expected us to be using these things half a century later. But the T-90 was so well crafted, it would be a shame not to bring it back to life. I've got an R-9A fixed up and waiting for its mate.

Thanks again for the help!

73,
Joe K9LY

Yes, that had crossed my mind. However, it was a conical penetration
that had a roughly circular external presentation. I suppose it is
possible that's what their tines looked like. But it didn't match
tines I've seen before.

Hello Joe:

I question whether there is a problem with the driver transformer. What are the symptoms, other than the different value of resistance? Is this just a general check of everything or is the audio section having a problem.

There are a number of possibilities. First, the factory could have substituted a different transformer from that specified. This happend more than infrequently, in order to keep the rigs flowing. They are not critical. Secondly, the ohmmeter might be something other than a pure dc, in which case the resistance might not be correct when inductance is involved. Another possibility is that the factory put the wrong transformer in the case and it got mismakred - but it was close enough that it passed factory specifications.

A shorted driver transformer could cause excessive current draw by the driver tube, or distorted audio.

If the winding ratio was different than the one specified, that would not cause any problem for the modulator, other than possibly lower audio because there was less drive to the modulators.

The 1958 thordarson catalog (which is about the time the T-90 was made) shows a number of driver transformers. None of them have numbers close to the number you cited.

73, Colin K7FM

>never expected us to be using them over 50 years later...hi..A great

The resistive measurements will not be the same because one half of
the winding is closer to the core and therefore has a shorter length
per turn. So that may have perfect AC balance, even though the DC
resistances don't match. The DC resistance is proportional to the length
of the winding, which is not directly proportional to the turn ratio.
In the case of the rig with the 390/400 resistances, it's probably balanced
better than you think.

But the origininal poster's rig... that 200 ohm number doesn't sound good
to me. Put 6VAC 60 Hz into the primary and measure the ratios... if there
is a shorted turn, the DC measurements may change a little or a lot, but
the AC measurements will be totally off. On the other hand, you may have
a different transformer than was original; if so the DC measurements will
be completely off but the AC numbers will be fine.

There is this pithy little thing I found in the ARRL Handbook:

The Amateur's Code

The Radio Amateur is

CONSIDERATE...never knowingly operates in such a way as to lessen
the pleasure of others.

LOYAL.....offers loyalty, encouragement and support to other amateurs,
local clubs, and the American Radio Relay League, through
which Amateur Radio in the United States is represented
nationally and internationally.

PROGRESSIVE...with knowledge abreast of science, a well-built and
efficient station and operation above reproach.

FRIENDLY......slow and patient operating when requested; friendly advice
and counsel to the beginner; kindly assistance, cooperation
and consideration for the interests of others.
These are the hallmarks of the amateur spirit.

BALANCED......radio is an avocation, never interfering with duties owed
to family, job, school or community.

PATRIOTIC.....station and skill always ready for service to country and community.

--The original Amateur's Code was written by Paul M. Segal, W9EEA, in 1928.

Kind of old, and flavored a lot like the US was during the time, but
never-the-less, it has some important lessons in behavior and compassion
that seem to be lacking in your vision for the hobby.

-Chuck Harris

Hello, Colin. This is just a general check before applying power to it
for the first time. I wanted to fix any obvious faults before applying
power. (Building the power supply will be the next part of the project!)

I've decided to leave it in for now and (carefully) watch what happens.

> A shorted driver transformer could cause excessive current draw by the

Will put a Simpson 260 across the cathode resistor to watch for
excessive current.

Good to know that. I see that Antique Electronic Supply sells a Hammond
124D driver transformer that looks to be pretty close, in case the
original really needs to be replaced.

> The 1958 thordarson catalog (which is about the time the T-90 was made)

Thanks for checking. That's exactly the right time frame. I'd bet it was
a custom part, and won't appear in any catalog.

I appreciate your comments, Colin.

Hi Scott. Yes, I'm suspicious of that 200 ohm number too but have
decided to leave it in for now and carefully see what happens. Your idea
sounds good and I may give it a try. Can actually check it at ~1 kHz too
with an AF generator.

I have a Hammond Power Supply built by Hammond of Canada (with a nice transforner) and have tried both the Hammond site and the VE listed as Historian with no replies.

Does anyone know where I can get info on the supply (manual or at least a schematic)?

These wer built by Hammond in the 1970's and they still make transformers but the actual power supplies.

Anyone out there have a manual and diagram for Kantronics Freedom VFO.
This was manufactured in the late 70's.
Will pay copying and postage charges.
Thanks

My favorite shipping fiasco came from drugstore.com. My wife ordered
some stuff, including a couple of Christmas presents from them last
year. Among the items she purchaed was a bottle of liquid chlorphyll,
which she likes to drink for here digestion.

They shipped it in their usual big box, with NO padding! Of course, the
glass bottle of chlorphyll was smashed, which stained everything in the
box, plus probably everything it came in contact with in the mail, a
bright green! The post office was not happy with that one!

Well, we agree that we should keep this requirement, but I don't agree
that CW should seen as reflecting poorly on us hams. CW operation,
albeit old fashion, remains a useful skill that I think should be
encouraged. I do acknowledge that the new digital modes and computer
based CW does make CW skills less necessary, but I don't think we
should consider it old fashion or out of date.

A question well stated, Slow Code...
No, it is a telephone conversation. Period. And that is what the whole hobby will turn into if the self-righteous, lazy whiners get their way and code is, once and for all, abolished. They all have contributed to the hobby's deterioration so far and don't like the fact that a few of us have got their number and can assess them for what they are. What do these simple-minded idiots think will happen if, as they press forward, they get all testing removed? The simple fact is that this is all a set up so the frequencies can be auctioned to non ham interests. The morons in Newington whimper about the reduced ham population. Geez Louise...there are many times more hams today (including those with the "faux" ham licenses not requiring code) than in the post WWII ham "boom." Not enough?

No kids...this whole code thing and the watering down of the test is simply a matter dividing and conquering so "they" can come in and tell us that our numbers don't justify the spectrum. Then...pfssssst!!!...there goes one band after another.

If any of the no coders had any balls they'd be asking the fcc for real testing and redevelop the hobby into what it used to be instead of the inane weekend contesting and buffoons sitting there are sideband comparing which rigs have the most features.

Idiots.

Source record: 10771
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

I've always been a sucker for lost causes and high tube count
boatanchors, so when I came across this SP-600 I had to
have it. This beast had been sitting on the floor of a damp garage
for decades unprotected. I spent 3 hour cleaning out mouse
turds and black widow webs. There's still an elusive black widow
that I haven't been able to kill. The top of the chassis isn't just
dusty, its crusty dust thats been hardened with mouse piss!
Yuck! Is it restorable? Maybe, with a lot of work. I'll check
the IF's and all other coils and transformers today.

The good news is its complete except for the crystal phasing
and main tuning knob as well as the handles. If anyone has
these for sale or swap, let me know.

Oh yeah, its a JX-26. Just like the one I rebuilt last winter. ;-)

Steve

Oh yeah, I really miss the days when the grouchy old
AM hams ceaselessly complained loud and long about those
"Single Side-Winders" on their personal AM frequencies
with that new fangled Mickey Mouse mode from hell (SSB).

3725. Hammond Power supply info needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-03 18:20:32 UTC
From: David Thompson <thompson@mindspring.com>
Message-ID: <QRxUg.4586$Y24.2780@newsread4.news.pas.earthlink.net>
Source record: 10775

I have a Hammond Power Supply built by Hammond of Canada (with a nice transforner) and have tried both the Hammond site and the VE listed as Historian with no replies.

Does anyone know where I can get info on the supply (manual or at least a schematic)?

These wer built by Hammond in the 1970's and they still make transformers but the actual power supplies.

73 Dave K4JRB thompson@mindspring.com

As I recall these were simple linear power supplies. Transformer to
rectifier to capacitive filter, to regulator stage. Regulator stage was
a 2N3055 or something with a smaller transistor driving it. You should be
able to draw the whole thing out in ten minutes.

Steve,
FYI... SP-600 do not and never did have rack handles. I know they'd look nice with them but they just didn't come with them. The only SP-600 knob I have left is one of the 0-10 knobs. de K3HVG

Make that a $4,550 SX-28.

I gave up long ago trying to psychoanalyze eBay bidders.

Sure, it's a loony price. On the other hand, it's a tedious and occasionally fiendish receiver to restore from the bottom up. Don't ask how many hours I spent restoring my first and second SX-28s. (Hint: everything's easier the second time around, and Number Two is definitely the keeper.) I guess there are plenty of collectors out there who don't have the expertise or patience to do that work on their own.

I'm not of the school that likes to machine-buff every inch of the chassis. Clean it up, even use Naval Jelly and/or metal polish to make it presentable, but sheesh!

And for the record, if you can't find a very nice and easily restorable SX-28 for a few hundred bucks, you're just not trying!

Brian -

What generator is that you haev on the left side of your workbench.

I think I have only seen one other of these ..... can't remember it (model)

I'm sure you're right, but the JX-26 I restored last year has handles,
and they appear to be original. The one I just got has holes in
exactly the same place, and sure look like they were there
originally. Is there a chance that some versions had them but
most didn't?

I think your refering to the Simpson Genescope. Very neat peice of gear. I
got it from Chuck Dachis a few years ago. Heres a little info on it:

Brian,
I have one of these (Genoscope) as well. It is a very interesting
piece of test equipment. The mirror for the scope is the thing
that made me buy mine.

I'm too chicken to hose down the SP-600. I've dealt with
too many radios that had open IF transformers due to corrosion.
I don't want to wash the mouse piss into those IF cans!
I'll do it the hard way. No pain no gain!

And, what is the problem. What would you do if, instead, you found a brand new, in the box, SP-600. You would have to leave it in the box and not touch it. Even worse would be to find one in a sealed box. Then, you could x-ray it and store it safely.

But, in your case, you will restore it and know every inch of it. And, because it is less than perfect, you can use it. You can even make modifications to it without getting the blessing from the pope.

If you do not have 1/2 a dozen rigs in your collection that start out like that, you do not have much of a collection. I know some collectors that consider every rig that is a bit less than perfect as a parts rig. That is an admission of failure.

Sounds like my Weller TCP-1 collection !!

They all work from the 1966 black bakelite to the last Navy contract
1976/1977 versions

Just picked up a Weller (UK) version -- that has Bulgin plug. That plug
arrives later this week - and then this one will be mated with matching
iron.

When does it end? ever?

Colin,
No problem here. I'm happy to have it! All I was saying is
I've never seen a radio in this kind of condition, and thats
in 35+ years as a ham and collector of radio stuff.
I cannot describe its condition.....you'd have to see
(and smell) it. It will be a major challenge to restore.
